4632. Re: Orion II ALC

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-01 00:37:32 UTC
From: reinaldoleandro
Topic: 4621 Message: 4632

Dear Tom N6AJR and Jerry KG6TT

Thanks for the answers to my question.
Yes, I too do not use the ALC on my amplifiers, maybe last time was briefly in the early 70s when I assembled my first Heathkit SB220, just to play on the safe side.
Now I have a couple of Alpha 87A, they need between 45-55 watts input for 1.5 Kw out, and they are able to protect themselves shutting down if there is excessive grid current. I have also a couple of 3KA and they can handle anything you throw at them. The Expert 1K-FA is also capable of self protection in case of to much exciter power.
The reason for my question is because the Expert and MFJ antenna tuner were acquired to be use on temporary operations like IOTA or DXpedition with less than perfect antennas and operators no familiar with the equipment. The Expert requires just 18-22 watts to full power and the MFJ antenna tuner warns not to use more than 25 watts when automatically searching for a match.
Any way the question is mostly academic, I do not beleive there is a need to carry the Orion II around, unless we go again to Aves YV0.
Incidentally Jerry, the 1K-FA is a very nice little amplifier. I bought mine in Rome last November and hand carried it by Dubrovnik, Frankfurt, Madrid and Caracas.
I visit the factory in Rome, they handle a very nice and small operation, each amplifier is thoroughly tested before shipment and the staff and owner very enthusiastic on their job.
Thanks again and wishing a Happy New Year to all.
73

4633. Re: Orion and h.w. modification to support release 2

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-01 22:09:39 UTC
From: pa1ap
Topic: 4625 Message: 4633

Greetings Duane,

Thanks for your reply! got another confirmation from the fine people from tentect service and indeed the hw modification will be detected automatically by the orion and when you keep pressing the menu button it will include a line to confirm this! thats pretty impressive imho.

the big question is then if release 1 as many of you seem to prefer will work with this modification in place or visa versa if release 2 software will work as designed without the modification :-)

looking at the ling list of fixes they included in release 2 it feels like release 2 is better to use. But my preception might not match reality due to lack of experience on the rig itself.

Counting the days until the unit is in the shack... mean while working and preparing some new antenna's although the time of year isnt really the best to pick (i can see people iceskating looking from my shack)....

Thanks and best regards,
Onno, pa1ap

Yes, release 1 works fine even if v2 mod has been done. And the v1
sweep still works (I just turned the sweep on for the first time in
about 3 years to confirm this).

> looking at the long list of fixes they included in release 2 it feels
> like release 2 is better to use.

Yeah, I guess it depends on how you define "fixes" and "better". I
like "unfixed" better .

73/HNY,
Barry N1EU

4635. WTB Orion II

Yahoo group: orion565 (2009 — 2013)

From: w3qj37
Topic: 4635 Message: 4635

Want to buy Orion II. All offers graciously considered. If you are considering selling yours, please consider contacting me @ 214-298-2768, or email tlp1@.... I'm hoping anyone that considers contacting me about selling theirs wouldn't mind emailing me some clear pictures, and mind telling me a little about the radio, such as 1st, 2nd, 3rd...ownership, how old it is etc. I'm not in the radio resale business, just an individual looking for a fair deal on an Orion II. I prefer to pay with pay pal, but will consider other methods of payment to meet sellers requirements. Please consider contacting me if you have one to sell.

Many thanks to the group owner for letting me post this and all who take time to read it.

All the best,

Terry-W3QJ

Tnx for the info Onno, I now have confirmation that mine will arrive on
monday, I too am counting days, hours, minutes ... well you get the idea.

Hny to you and all the other Orion owners out there.

Hello Onno,

I would suggest, if your Orion has the Version 2 hardware modification done on it, I would start with the version 2.xx (latest level) firmware. For the most part, it works very well. There are some changes made in it that you may not like - for example, the AGC was moved outside of the IF chain, such that when you use noise suppression, or auto notch, the removed signals will still kick your AGC up. In Version 1 firmware, this worked as you would expect, with the AGC unaffected by the removed signal. However, Version 1 had issues where if you ran the 'sweep" along with any of the other DSP features, it could cause the radio to "hang" and you had to cycle the power to restore operation. It seemed to me once the version 2 hardware mode was on the radio, the instances of hangs dropped considerably.

I hope you enjoy your Orion - I've had mine for a few years now, and I really like it.

Best wishes to you and your family in 2009!

Kevin, I got my ORION II to ragchew, and also as an experiment. I was all set to purchase an ICOM 7800, but a friend talked me into "trying" this ORION II for a month for free, then sending it back and getting the ICOM. Well, I got the Oii and haven't looked back. ICOM can keep their 7800, in 33 years of being in the hobby, this Oii is the nicest radio I've ever owned. It's like listening to FM Quality audio on SSB and it can do everything the 7800 can do and it's quieter.

The radio my ORION II replaces is an ICOM 756pro, and I haven't turned it on since the day I got my Oii. I think you will enjoy yours whether the sunspots are up or down.

73,

Sam

My wild-a$$ guess would be 2000 O's, 2000 O2's, 2500 K3's, 7500 FT2K's, 10000 Pro3's. The Elecraft number is accurate, the others could be WAY off.

One nasty feature of the "v2 hardware update" came back to bite me recently. The LCD contrast defaults (e.g., after a Reset) to a near-zero contrast mode -- especially when my rig is cold. And of course you have to use the screen menus to go in and adjust the contrast! On my rig, I need to use about 30%.

So either you heat up the rig, or you have to stare *very* carefully at a nearly blank white screen to get the rig usable after a Master Reset.

And a happy new year greeting!

Maybe your W.A.G. is better than mine, but in general, data is worth what
you pay for it. I imagine even the manufacturers don't know about their
competitors with certainty, although dealers would have some of the figures.

This is something ARRL or some other recognized body could do -- a
(moderately) scientific survey of how many rigs are out there of various
types.

Martin,

From experience, open your rig again and spray all of the connectors for the CPU and display board. I had trouble with my display and Ten-Tec "fixed" the problem by replacing the display pot. But it came back. It was not until I went after the RIT/XIT problem and found the connectors to be the problem did I learn to spray them. Also while you have the bottom off the rig, set the display to 50% and then adjust the pot behind the main tuning knob. It is similar to the mike gain pot in mounting method, but there is no hole in the case to get to it with out removing the bottom.

73,

John

Hello

Maybe someone in this group can help.
I have a Orion I with a little issue , i think.
In the 40 meters band the band sweep scope display only big signals.
This happens only in this band and in any case the reception is ok.
Any suggestions ?
Thanks
Franco I6QFZ

Onno,

Check out hamlib.org for a rig interface layer. I use it with xlog, fldigi, and several small Python apps that I wrote. (www.aa6e.net/software) Also check http://radio.linux.org.au/ .

What distro are you using? Some of these are distributed through the repositories.

I am installing qemu which is an application allowing windows to be
run within Ubuntu.... This will allow me to run windows applications
on top of Ubuntu. Not the best solution though...

anyway, trying the other tools as suggested by Martin.

Best regards,
Onno

Onno you also owe yourself trying Sun xVM (formerly known as VirtualBox)
easy to set up and to get to work - only drawback is that USB seems to
be broken under Intrepid Ibex...

I have downloaded and installed it without problems on Ubuntu 8.10.
I can't seem to register on the website (to participate in forums etc)

When trying to import an ADIF file with all my existing QSOs (from
VQLog) almost 1000 QSOs are sent to the errorlog.
One problem I recognize is the recognition of the JT6M, JT65A, JT65B,
JT65C, FSK441 and WSPR modes (all supported by the WSJT SW)

4660. Visual representation of Orion AGC function

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-06 09:52:57 UTC
From: pa1ap
Topic: 4660 Message: 4660

Greetings group!

Browsing through the messages in this group there were several discussions on how the orion AGC works. I believe i am starting to understand the principle.

I am curious if someone made a visual representation of the AGC function, its behavior, the relationship between AGC elements and possibly their dependency?

I sure hope you will not hammer down the discussion on this as I truely would like to learn and perhaps consolidate thoughts into an easy to understand picture. I have uploaded a draft picture into the photo & Miscellaneous section called "Draft visual representation Orion AGC".

My assumption & current understanding:
Picture 1 represents the AGC funtion at high level. It has two elements; dsp agc and hw agc. Within dsp agc the threshold determines the lowest value where agc will start and also the lowest value of the rf gain dial. Put threshold at lowest value; large coverage for rf gain dial. Other way around, put threshold at high value: smaller coverage of rf gain dial.

Picture 2 represents IF gain versus AGC. The knee is determined by threshold and the slope is determined by decay.

Picture 3 I just rotated picture 2 and put some signal into the graph. Signals below the threshold are uncompressed (original) and above threshold compressed by AGC at a speed determined by Decay.

I would really appreciate the groups advice and experience and hope we can arrive at valuable conclusions!

Thanks and regards,
Onno, pa1ap

What version of firmware are you talking about? The AGC works completely differently between early v1, late v1, and v2 firmware and therefore so does adjustment technique in the three different cases.

Greetings Barry,

I guess latest v1 and v2 code. Would be good to understand both and the differences between them... I guess the tentec manual covers v2 code and this is what i took as the reference for the sketches I uploaded into the photo section.

By the way, i realize i did not include "hang" time into the drawings. Eating the elephant in small chunks :-)

Best regards,
Onno

I just purchased an original Orion. It is running ver. 2.067a firmware
Is this the best to run and the most stable or should I upgrade to a
later version
Thanks

Many of us feel strongly that 1.372 or 1.373b5 (not availble thru TT) are the most stable and useable firmware versions. Search the archives and you will learn much about the various versions. Me, I use 1.373b5 and spend 99% of my radio time on cw chasing dx or contesting.

It depends on how you want to use the radio and what you want it to do for you. The good news is you have choices. The bad news is you need to know what you want the radio to do to choose. Perhaps you want to try several and see which is best for your application. 73 bob de w9ge

Would it be a good idea to upload some of the "good but older" firmware releases? Even if I want to downgrade the unit I wont be able to do so through the official tentec website... Or did I overlook something?

Thanks and regards,
Onno

My shiny new Orion 2 arrived today, and I'm in love already!
Only complaint so far are the puny Send1 and Send2 memories - far to short for even a contest CQ, and I'm too lazy to use Send3 (needs to be reprogrammed after each off-on)
Maybe the SW guy at TT have fixed it in the upcoming release?

Incredible Rx audio (I'm mostly a phone guy + some Digital (WSJT, WSPR, PSK31 and RTTY)) and reports on Tx audio (I bought the 708A desk mike with it) excellent.

Spent about 12 hours with it today, trying out stuff, reading the manual and QSO'ing.

I believe the newest firmware version for the Orion II has done well in testing and should be released perhaps by the end of next week(?), but schedules can slip. Anyway, once that version is successfully released Ten-Tec engineers (time allowing) will prepare/test the Orion 565 variation of this new firmware. Although the two transceivers are very, very, very, close kin to one another there are some differences from a firmware perspective.... so when that will be ready is still vague.

I used many variations of the Orion 565 firmware over the past three years... including 1.373B5 for a long time. Eventually I came back to the current version 2.062a for its overall stability improvements.... and I suppose from the knowledge that version 1.x whatever was a dead development branch and that all future work would be based on 2.062a. Are there differences? Yes, I think so. Are there 1.x versions that are superior to the current branch? Not to me. There are some aspects of 1.373B5 that I do like better, but conversely many more aspects of 2.062a that I miss when going backwards to 1.x.

Probably, the most important lesson for me as a now very 'happy' Orion owner was to finally appreciate that the Orion is NOT an Icom, or Kenwood, or Yaesu or Elecraft. To really appreciate it you must learn to drive it differently. For example, with the Orion there are real advantages to NOT running the RF Gain control wide open, but rather operate with the AF GAIN greatly advanced and adjust your listening level with the RF Gain instead. Once you hear a slight peak in the antenna noise you have obtained the 'sweet spot'.... the greatest possible signal-to-noise ratio... with this transceiver (talk to the engineers that built it and use it). Such is not always the case with more traditional transceiver designs. The Orion has a LOT of gain which can make it appear to be more noisy than those other rigs... but only if you drive it peddle to the metal! Learn to maneuver it around those hard corners and pick up speed on the straightaways and you leave the competition in the dust. :)

Have fun discovering probably one of the best transceivers ever designed.

73,
Jerry, KG6TT

Oh I'm having a great deal of fun, and I'm adjusting to this strange way
of using it, even though I owned a Paragon for several years, it's quite
an upside down from whatever I've used before...

Hopefully the new firmware will fix the AGC implementation and gain distribution, making the learning curve a little quicker.

I still don't seem to understand this logic of the RF gain and AF gain control vs. the use of AGC threshold. Can someone explain the difference in those two methods for the 566 or does the RF Gain/Af Gain logic only apply to the 565.

Brad

4679. Re: Visual representation of Orion AGC function

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-08 08:39:51 UTC
From: pa1ap
Topic: 4660 Message: 4679

Greetings,

Barry thank you for the hint for tentecwiki on 565. Found a document written by Doug Smith on AGC design. With a couple of changes the visual representation would work I believe.

Now the challenge... My guess is that Doug described the functionality with reference to some release 1 code. I have seen a document that prior 1.37 code the RF gain control was only on the hardware and post 1.37 the RF gain control controlled both dsp and hw agc. Am i correct here?

What happend in release 2 is a bit of a mystery right now. The specifics on the real change isnt clear yet, I will continue to explore and read around.

So far my conclusion is the following (right or wrong...):

1) threshold defines the area from 0 (well 0,1 uV according manual) up to threshold value where AGC is NOT activated. All signals within this range will be amplified with linear behavior.
2) signals which fall within the threshold range are amplified based on the decay value and associated ramp-up speed (slope)

3) signals above treshold will be attenuated based on "something"... I guess its the inverse of the decay value but this is unclear.
4) RF gain dial covers the area starting at threshold value up to max value (100% of something) and includes dsp and hw agc.... (post 1.37) I am not sure how I can represent this "max value"...?

In the document there is a reference to max dynamic range when threshold is set to lowest value and RF gain is set to 100%. Followed by explanation changing the threshold would lower the dynamic range...

One of my confusions is on the comment where increasing the theshold would silence the audio... followed by the statement that lowering the threshold would result in increased audio due to the fact the system wants to meet the output level criteria... The first I understand, the latter is a bit unclear to me... Where am I missing the logic on this?

Appreciate any advice from the group!

Best regards,
onno pa1ap

The major change occurred in v1.372 (pre-release version 1.372b23).
Prior to v1.372, you had to adjust both RF Gain (30dB analog gain) and
AGC Threshold (80dB dsp gain) to control Orion's total gain of 110dB.
With 1.372 and 1.373, the functions were combined so that you only had
to adjust RF Gain (110dB combined gain) during routine use after a
one-time setting of the AGC Threshold to a low value (e.g. 1uV).

The gain distribution that worked well in 1.372/3 was abandoned in the
v2 re-write and I can't recall ever seeing a technical description of
v2 gain distribution. I do know that many of us found v2 rx gain much
more difficult to control to get the receiver set up correctly for any
given band conditions.

Thanks Barry!

Just curious... do you ever sleep? I will continue to explore and
will try to document through visual pictures. For me visual is the
way I learn & document and perhaps it will become of use for others...

Let see if others have some hints about the questions.

Best regards, Onno pa1ap

Taking a leaf from the FT-847 book: Keying the transmitter from the AUX (called Data by Yaesu) port enables AUX-In and disables Mic-Input, and vice versa - should be a very small matter to implement in SW, but immensely useful for the occasional Digital-mode user.

A question for the O2 owners: Is the threaded part of your Mic socket kind of loose too? (the central part with the pin receptacles is firmly seated) or should I worry enough to take the front assembly apart to fix it?

Peter,

That's an interesting suggestion. I use "User 1, 2, 3, 4" to allow me to switch modes among digimode, cw, ssb, etc. -- changing all the appropriate settings. Switching the from MIC to AUX is only part of the problem. And it's annoying that User 3 and 4 don't have pushbuttons!

TT has not made it easy to switch modes "manually" from the front panel, since you might want to switch the audio source, equalization, the AGC and DSP settings, and then tune into the right sub band. Not all that hard, but a lot of button pushing and encoder twiddling. Fortunately, the "user" switch option covers most of this.

No troubles troubles to report with the mic connector on my O1.

Barry said:

"The gain distribution that worked well in 1.372/3 was abandoned in the v2 re-write and I can't recall ever seeing a technical description of v2 gain distribution."

Barry is correct that the gain distribution across the Orion significantly changed in the V2 Orion/Orion II code rewrite (By the way, except for the "display code,"and a couple of other differences in the roofing filter switching, the Orion and Orion II DSP code have been the same - up to the current release). After Doug Smith left, TenTec needed to "fix" the stability issue in the V1 code. As part of doing that, the decision was made to "redesign the code in the Orion/Orion II" to be a closer "design match" to the design in the Jupiter and other previous TenTec rigs that used DSP chips (This was a "huge change decision"). This resulted in the design of the V1 code being changed for much of the functionality that was in the signal detector functions (CW/balanced modulator/demodulator etc) and everything that followed to the AF audio output to the audio amplifier chips. This included the design of the notch functions - which were audio based in the Jupiter - meaning that the notch did not removed the carrier impact on the AGC. This also resulted in a big change in the "overall feedback structure" in the V2 code from the V1 code. TenTec said this was "needed" to "fix" a "small signal" "noise" issue in the V1 code - surprisingly this was never detected either by the ARRL tests of the Orion or the Sherwood engineering tests - seemed, to me, like a "red herring" to justify the redesign that created many level problems in the V2 code. This resulted in some very strange "ideas" about using AGC hang and other adjustments to reduce the distortion caused by peak signal overload issues that were created by the redesign and the changes in the feedback control loops. Thus, began the "gain distribution tweeking" that has never really cleaned up the distortion issues. The last few changes included AGC design changes - in conjunction with work with Rob Sherwood - to try to reduce the impact of short pulse noise on the gain of the Orion/Orion II RF gain - this has to do with the "blazing speed" of action of the computer controlled AGC versus the old analog design "capacitor charge/discharge" AGC circuits.

In fairness, TenTec did make some big improvements in the later issues of the V2 code in areas like the performance of the voice compression, which had been wonderful in the V1 code and really broken in the early V2 rewrites. The Noise Reduction code in the V1 code actually was quite sophisticated and used four different kinds of filters to try to reduce noise - even in cw operation. In the V2 code TenTec changed the

code to be essentially an LMS (Least Mean Square) single high pass filter with a "soft squelch function." Some people liked one or the other implementations better - as with all things, it depended on how you used (Setup in operation) your Orion/Orion II. Overall, I like the performance/functionality of the V1 code much better then the V2 vode. If you haven't seen the performance of an Orion - with the V1 code - you haven't seen how good an Orion can be. On the other hand, if you haven't lost the subreceiver, while working a rare DX pilup, you haven't seen how bad the V1 code can be.

I look forward to seeing what TenTec has achieved in the new Orion/OrionII firmware. I told one of the TenTec principals that I would buy an Orion II the day after the V2 code was as good as the V1.373b5 code - but stable. I'm still using the Orion.

Greetings Merle,

Thank you for providing this clear description about the changes
applies in v1 to v2 migration. I will continue trying to visualize
1.372 agc implementation to support my own understanding. If you could
provide guidance on my findings that would be excellent!

Thanks and best regards,
Onno

Hi Peter

My O2's Mic socket is like the one you describe.
I think all Orion II have the same and I don't know why TT do that!
After a conversation I had with UK's major distributor of TT radios he confirmed that all Orion's have the same socket.

Ημερομηνία: Πέμπτη, 8 Ιανουάριος 2009, 13:47

Taking a leaf from the FT-847 book: Keying the transmitter from the AUX

(called Data by Yaesu) port enables AUX-In and disables Mic-Input, and

vice versa - should be a very small matter to implement in SW, but

immensely useful for the occasional Digital-mode user.

A question for the O2 owners: Is the threaded part of your Mic socket

kind of loose too? (the central part with the pin receptacles is firmly

seated) or should I worry enough to take the front assembly apart to fix it?

4692. Orion and Logger32

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-09 07:16:28 UTC
From: John Hudson
Topic: 4692 Message: 4692

I know this is probably a Logger32 issue but I wanted to run it by this group and others to see if there has been anything like this before. I hope I have explained it but it was originally sent o the Logger32 group

Thanks

John
KO4XJ

I have been using L32 for a few years now with my TT Orion 1 and not had a problem at all but since the 3.16 was updated I started having some funky things happening and I just found where it's coming from Currently I have updated to 3.16, Orion firmware 2.062a which I've had since it came out 2007..XP Home Edition SP3 and have 4500+ in the logbook

Here's the issues

Whenever I click on a dx spot OR enter a freq in the callsign window the rig changes correctly BUT when I try and adjust any thing like RF GAIN, MIC GAIN, STEP AGC ATTN, controls that are around the display of the Orion those items do change but the value that is on the display does not change. EXAMPLE... if I crank the RF back, the rig is working but whatever value was on the display stays lock on the display. If I turn the SWEEP off, the display just freezes.

Ok so I try other programs, MIXW works perfect, N1MM works perfect, DXLAB works perfect.

The only that had been changed was the 3.16 update..so I thought just to see and I load 3.15 back and it worked fine as far as the controls. Then I loaded 3.16 back and the problem is still there.

Another thing that's wierd is that it does it on 160,80,20,17,15,12 and 10. 40 Meters seems to be uneffected and works ok.

Now what I can do is press the MENU button or the AUDIO button and go to their menus, go back to the main display and everything works until I click on a DX SPOT or enter a freq again

I've done MASTER REST and BATTERY FAULT RESETS and reloaded the 2.062a firmware on the Orion and still the same issue

This weird I know but looking for some ideals

4693. Re: Visual representation of Orion AGC function

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-08 20:12:03 UTC
From: pa1ap
Topic: 4660 Message: 4693

Ok, below my first attempt to reflect what I have learned so far. Hope constructive advice and guidance can be provided by the group! Looking forward.

Description visual representation Orion AGC p3 (see photo section)

Firmware post 1.372

Reference picture; element 2
Within the receiver there is DSP based AGC and Analog AGC. The DSP AGC controls from 0% up to 72% of total gain and Analog AGC controls the 72%-100% range.

Reference picture; element 3
Element 3 connects the Threshold setting to the DSP AGC starting value. Its like a slider you can move to the left or to the right to determine where the DSP AGC will start taking effect. In other words the Threshold cam decrease DSP AGC control area. For example one could move the threshold to the right and set it to 40%. The DSP AGC would at that moment only control the last part of the DSP AGC range (40-72%).... Any signal between 0% and 40% would remain uncompressed and hence sound will vary based on signal strength, until you decide to include Decay into the discussion.....

Reference picture; element 4

Two events within this element; conform threshold and exceed threshold

Conform threshold;
I am confused about the statement Decay in relationship to increased gain. The manual describes Decay in the following manner;
"Decay is used to determin how fast the if gain increases in the absence of a signal above the threshold value" [rev3 feb 2005].
although Decay refers to decreasing a value, here its used while looking from the oposite direction. Anyway, signals below threshold will not be compressed and their volume will increase following the Decay setting....

Exceed threshold;
Surely signals exceeding the threshold require compression to avoid the speaker to bust into flames. There is no reference made on how this actually takes place but I assume it is actually the same Decay value but hopefully someone can explain or confirm.

Reference picture; element 1

The RF Gain dial range includes both DSP and analog AGC. One thing to realize is that the start of RF Gain is determined by the Threshold value. In other words, setting threshold at a high value will decrease the operating range of the RF Gain dial.

Reference picture; element 5

Taking the total dynamic range of the receiver and map it to the DSP AGC and Analog AGC.

Taking examples from the manual and applying them to the picture;

Example 1;
"adjust threshold value to a high value, like 31.91uV. Note how overall receiver noise has dropped with the gain reduction."

I believe what they mean with this is that because the start value of the RF Gain dial has moved to the right the net result of that action is that the gain is decreased. I assume this is the same as saying "we decreased the dynamic range".. How this relates to the Decay value for signals below threshold is unclear to me... any advice?

Example 2;
"Listning to band noise with the threshold set to the lowest value and the RF Gain set at 100. With these settings, receiver gain is at maximum".

Is my understanding wrong this case assumes band noise to exceed the threshold?

Example 3;

"At thresholds near the noise floor, all signal are boosted to meet the output-level criterion".

I admit, in case you did not think already, I'm lost on this statement.... I assume the output level criterion refers to the signal level arriving at my ears through the audio chain (AF volume dial).... How does this connect the things together?

I hope someone can advice and provide guidance. I really like to learn how the AGC operates.

Thanks and best regards,
Onno, pa1ap

4694. Re: [orion565] Orion and Logger32

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-09 23:22:08 UTC
From: John Hudson
Topic: 4692 Message: 4694

I was directed to the cause of the Orion and Logger32 problem I had and
it was due to a change in the Logger32 update and here is the fix

One of the things that was changed in the latest version of Logger32 was
the
need to issue three commands to the radio following a click on a dx spot.
As most sets do not require this the third command was removed - or
actually
made a user select options. The default for this is OFF so please try it
with the option set to ON.
Use the menu option Setup|Radio|

Radio 1 config and make sure that the "Radio
changes freq when mode is changed" option is checked.

JUST IN CASE SOMEONE ELSE HAS THE PROBLEM

From: Barry N1EU
Topic: 4660 Message: 4695

When a strong signal is present, gain is reduced. When the strong signal disappears, gain increases. Decay refers to how quickly the gain increases (dB/sec) when the strong signal disappears.

You are trying to understand a complex system that hasn't been well documented.

In v1.372/1.373, the action of the RF Gain control is not merely dialing in the gain value of 0-110dB. It also varies the AGC Threshold as you rotate the knob. Threshold decreases as you increase RF Gain - exactly by how much, I don't know.

All disclaimers apply to the accuracy of any of this. I think you should just play with the radio.

4696. Re: Visual representation of Orion AGC function

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-09 21:15:03 UTC
From: pa1ap
Topic: 4660 Message: 4696

Seems I wasn't that far off with my draft. Merle has send me a great picture from tentec which describes the pre and post 1.372 release. Granted it doesn't describe release 2 but it helps for sure. Check the photo section for more details.

Reading through all other suggestions as received by email. There are lots of good ideas and suggestions! Thanks you all for sharing.

The visual representation is getting more complete by the day and please keep suggestions coming.

Best regards,
onno pa1ap

From: w6lara
Topic: 4697 Message: 4697

hello everyone im having some issues with my orion 2 i fonund the problem WHY IT WOULD DO A MASTER RESET WHEN YOU TURN IT ON. THE FIX WAS THE BATTERY CAME LOOSE ON THE LOGIC BOARD BEHIND THE FACEPLATE. IM HAVING OTHER ISSUES WITH THE RADIO. THE ANALOG S METER MOVEMENT DOSE NOT WORK PROPERLY SOMETIMES IT WORKS SOMTIMES IT DOSENT IT READS LOW SIGNAL ON RECIEVE AND TRANSMIT BUT OUTPUT AND RECIVE ARE FINE. IT USESALY WORKS AFTER 10 OR 15 MINUTES OF THE RADIO BEEING ON. ANY IDEAS WHAT IT MIGHT BE IM THINKING POSSABLY THE METER IS BAD WHAT DO YOU THINK

In all cases the Orion Meter is driven by a "digital to analog converter". The DAC is driven by the main CPU. Meter problems are likely either the meter or the DAC.

4701. v1 versus v2 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-12 13:15:54 UTC
From: hamilrs
Topic: 4701 Message: 4701

There has been considerable discussion about differences between Orion I v1 and v2 firmware but nothing mentioned about the greatly improved screen contrast of v2 which is why I've stayed with v2. V1 seems hotter, I like it better than v2, but I also prefer white screen text on a dark background which accentuates the decreased v1 contrast. If there's a way to have v2 screen contrast quality with v1 I'd be interested in knowing how. Thanks, Russ.

From: jddksk
Topic: 4703 Message: 4703

Hi guys first post new to the forum. I just picked up a used Orion 1 I've been using a Omni 6 plus for awhile now and just love the rig. My issue with the Orion is when I turn on the auto tuner it tunes the load just fine but, when returning back to receive the receiver audio is muted. After about 3-5 sec. I hear a relay slowly click closed or open in the AT and the receiver comes alive again seems worst on 14mhz. Also while keying the rig in cw can produce the same issue. Could this be a firmware or harware issue? firmware (2.062a) installed.

From: eduardomontana
Topic: 4705 Message: 4705

I have a question that i am wandering is someone can help.
I have an Orion 1, with the latest software V 2.062a; when I turn the radio on the Orion's display states "2.04b7", i don't know if it is supposed to match that of the software; hence my question.
I love the rig, it is far better than my Yaesu 1000D, trick is you have to know how to use attenuator, programmable AGC and RF controls, set them once never touch them again (unless you're changing your intended purpose, therefore fitness for purpose needs to be revised).

Without the info in front of me, I seem to recall that when you bring
up the Ten Tec utility to update the radio and click on "process," you
get a window that gives you a choice of different firmware versions.
You have to highlight the version you want, in this case 2.062a, and
it may be that the 2.04b7 was highlighted instead? Try reloading
again and see what happens...

If you watch the "splash" screen carefully, you will see both numbers. 2.062a refers to the overall firmware version, and 2.04b7 is the "DSP version" -- that is (I guess) separate code that runs in the SHARC DSP processors. You can examine this info at more leisure after boot-up by pressing and holding the "MENU" button. It also tells you if the "v2 hardware mod" is installed.

I don't know why TT thinks we need to know the DSP version, since it only changes when the main firmware version changes.

The 2.04b7 is the DSP version but if you hold the MENU button you will see the POWER ON display and you will see the software version you have installed, the DSP version and whether the V2 mod is done on your rig

Have you tried to reload the software and then do a RAM reset? I've had some weird things seem to happen and I reloaded the software and it cleared it up

Hello All,

Unfortunately for me I have fell upon hard times and must sell My O 2 A.S.A.P
My Orion 2 comes from a non smoking home and comes with the following, The 1.8, 600 and 300 Hz filters. It also come with the latest firmware, the 302r remote keypad/encoder and a Heil HM-5 Mic.

The rig is in excellent condition any reasonable offer will be considered. I must sell A.S.A.P. I live in Raleigh, NC

I called Ten tec and they had me do a master reset-memory clear on
the rig.After reset muted receiver issue still there, it seems to be
only on 20m-10m? so much for QSK on these bands for now. Dave

Dave,

There is a bug in the software. If you have the sub-receiver on AM and the main receiver on SSB and hit transmit, the head phone audio disappears. It was an old problem and was corrected and then introduced as a "new" feature in the latest addition. Do a reset and then don't use AM on the sub-receiver until the new software is released.

73,

John

Hello All, I had put a post on the reflector yesterday and after giving it some thought and due to my in experience in listing items for sale I thought it best to list a price.

I have an Orion 2 for sale a must sell! It comes complete with a 1.6, 6oo and 300 Hz filters. It also comes with the 302R Encoder/Keypad as well as with the latest firmware. The rig is excellent shape both in and out and comes from an non smoking environment.

I'm asking $1,800.00 a sacrifice but I must sell. Interested parties please contact me off list at W2IW@... or may call 919-441-2211

I have used my sub receiver in AM mode for SWL, but doing a master reset-memory clear did notthing to solve the problem it still persist. Battery reset did this happen with a master reset or is this some other procedure I've missed?

You are 100% correct, in all counts.
I am running 2.062a software version, the other 2.04b7 is DSO
version, it has the V2 mod as well.

Only minor detail is the button is not MENU but MENUS (with an s at
least on my radio) at the end.

Thanks a bunch for the prompt reply.

Did I say that I LOVE the radio?

Fixed two issues faulty AUX I/O din socket on back of Orion and
reversed factory wiring on Donner computer interface on the audio
lines, output was input and input was output. Aux socket was easy to
fix but a bugger to find intermittent connection. Dave

4724. Re: Visual representation of Orion AGC function

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-19 08:03:37 UTC
From: pa1ap
Topic: 4660 Message: 4724

Greetings,

Been reading through various materials, watching the ten-tec TV show (recommended) and studied some more material.

Found documentation written by YT1NT which was written very clear too and it seems to describe version 2 implementation.

Sinisa (YT1NT) writes that everything below threshold is treated with linear response. A weak signal will still sound weak and a little stronger signal (but still below threshold) will sound a little louder. In essence, as visualized through the pictures, the AGC is inactive below threshold. Still doesn't address the Decay variable though...

I am starting to believe that Decay does not come into play prior to threshold exceed condition. It makes sense from the literal meaning of Decay at least..... seems there is just linear amplification in the area between zero and threshold and above threshold the Decay value dynamically changes the gain distribution (in other words compress the signal).

The danger of putting the threshold too high is that your speaker(s) will burst into flames when a very loud signal suddenly arrives at your antenna. Putting the threshold at minimum level will compress the noise as received on the antenna, which is demonstrated and described in the manual too.

Couple of days and i will have the unit on my desk. Installed a new antenna to survive until summer time allows me to install the real antennas. Right now its to cold and wet to be outside...

I had an interesting answer from tentec sales and they might organize a tentec tv session on this topic. I am crossing my fingers for that one!

Best regards,
Onno pa1ap

4725. COmparison o2 vs MKVF?

Yahoo group: orion565 (2009 — 2013)

hi

Was toying with the idea of getting a O2, wonder if someone might have done a comparison they could share with me.

In particular what i am looking for is mostly comparing it's Receive capablities, specifically in local (to the shack) man made noise situations (IE NOT other ham signals,)noise like the misc. stuff you would find in a urban envoronment

If someone could compare how the O2 receiver it's ability to filter out the above and perhaps compared to a rig I know such as the Yaesu Mark VF that would be great.

thanks very much

N2EHG

don't know anything about yaesu mark 5 but really don't think my orion 2 does such a great job of filtering out line noise. the only exception is that using the sharp cw filter it does go away but on ssb the noise blankers distort the audio to the point it is not a pleasure to listen to it.

think my kenwood 950 h has a better noise blanking system.

I can't compare it to the Yaesu, however I can say that the Orion II is worlds better than the Icom IC756proII I had. The Orion II gets rid of my local noise. The Icom wouldn't even touch it. (I had both rigs at the same time and could do an A/B comparison)

I've done a comparison between O2 and MKV (not a Field version but they are very similar).
I ran A-B tests by switching the same antenna on different bands.
Both radios had full sets of filters and MKV also had Inrad roofing filter.

I never had an occasion when one radio couldn't pick up a signal that other could, no matter how weak that signal was. In the contests environment Orion acted somewhat better and it's DSP filters did greater job on very narrow bandwidth. This feature also gives ability to change bandwidth more smoothly comparing to Yaesu's set of separate filters.

Orion's audio is definitely better and gives ability to distinguish between two or more signals when on MarkV on tight filters it was more difficult to achieve. On the other hand MKV audio amp is impossible to overdrive while Orion's will produce distortions on big signals though the specs on it's output IC are considered to be very good.

To fight local noise crimes Orion has better NB and is able to work in presence of big neighboring signals. Sometimes receive becomes so crystal clear that you think that the interference's gone but when you switch NB off - it still there.

DSP noise reduction I find useless on both radios.

Hope it'll give you some idea about these radios.

4729. BCB Bleedover on my OI

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-23 14:46:52 UTC
From: Earl
Topic: 4729 Message: 4729

Greeting All,
I live 2 miles from the Mexican border in El Paso, TX. My problem has always been interference from BCB stations causing interference to my Orion I on most bands. I cleaned up all my grounds and this helped.
I have 2 KIWA BCB filters. Using the RX receiver antenna hooked up to the Orion, I have inserted these Filters and completely eliminated the BCB interference.
Does anyone know how I can insert these filters just before the PRESELECTOR and solve my problem.
J3 on the Preselector board A6 looks like the place to insert these BCB filters without compromising the radio. I would series them in using small coax and mounting the filters in the open spaces available in the Orion.
Does anyone think my idea would work without causing problems with the radio? These Kiwa Filters even eliminate BCB stuff from 160 meters during my tests using the RX ANT.
Regards,
Earl, K5FTE

From: Bill Axelrod
Topic: 4732 Message: 4732

I have an O2 and a Yaesu FT-1000 MP MK-V. I use them side-by-side doing SO2R in contests and usually have both turned on for every day operations. They are very different radios with very different strengths and weaknesses.

The noise blanker and DSP based Noise reduction circuitry in the FT-1000 work better for me than the equivalent in the O2. I have observed this action in two separate QTHs, one very very rural, and now in a more crowded, but somewhat rural setting.

That said, I can copy weaker signals in heavy QRN (atmospheric) much better on the O2 than with my Yaesu using the same antenna for these comparisons. Especially when I narrow down the bandwidth. I should say that I have a full set of filters in the Yaesu and a full set of roofing filters in the O2.

Other comments. There is no question that the O2 is much better in contesting environments where the bands are full of strong signals. The FT-1000MP is pretty good; the O2 is outstanding. I do like the crisp sound of signals in the Yaesu better than the "softer" sound of the O2. That's a matter of taste.

Bottom line: I have both. Which one I use depends on what I'm doing, band conditions and crowding, and, frankly my mood at the moment, I can't bring myself to get rid of either.

---

thanks very much to all those that replied

really appreciate it

was thinking it would be great if some company rented rigs so you can test them out
to either see how you liked them or if a particular rig solved a 'problem'

seems like it 'might' offer me a leg up on my particular issue (building got a
new elevator system using a magnatec 600 elevator motor controller, guess it's a scr
what i can say is it produces s9 noise

non of my current rigs (markvf & ts2000x) have the slightest effect on the noise, not
that i suspeced it would.

But the MKVF will typically pull a few of the louader signals out beter then the ts2000
which got me thinking perhaps a better rig like a o2 or 7800 or ft9000 might
either be a bit better mitigating the noise itself albiet a bit of a sttetch, or just being
a
better rx might help pluck out a few more signals from the noise than say my current
MkVF which does have the roofing inrad filter

again really appreciate all the info

Hello: Did your Mark V seem any better before you installed the roofing filter mod? The two stage IF amp has too much gain for the first IF. If you get better results without the extra 1st IF filter, you can modify the Inrad board to lower the gain, and perhaps reduce the noise and improve your noise blanker performance. Pse visit my wesite via QRZ.com for the details as to how to make the mod. Also, Ten Tec has a no quible policy on returns during the trial period. Give them a call for details. 73 and Happy DXing, Mike W2AJI

4736. FS: Orion-I and spare parts deal

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-24 18:26:33 UTC
From: Dick Green
Topic: 4736 Message: 4736

I have for sale an Orion-I with automatic antenna tuner, optional 1.8 KHz, INRAD 600 Hz and 250 Hz roofing filters, 302R remote encoder/keypad, 963 12V power supply, spare connectors and fuse, manual, box. Has the cool new rubber rings on all three VFO knobs (the old rings are included, too.) Updated in 2006 by factory, including V2 mod. V1.373b5 currently installed, but will install V2 if buyer desires. Excellent operating condition. $2,100 plus shipping CONUS. Will deduct $80 if power supply not desired.

If you like to repair your own rigs, here's a deal: I have a second Orion-I that was lightning damaged and declared "unrepairable" by TenTec. Surge entered via RS-232 port, and fried the RS-232 level converter and CPU. Something in the power input stage on the I/O board is fried as well. The T/R relay is missing from the I/O board, but have a brand-new spare that's included. The IF Converter board has a spur and is missing the ALC trim pot. Remaining boards are probably OK, but can't guarantee. All boards have been pulled from the rig except the CPU/LCD board. Not likely this rig can be fixed, and TenTec may not sell replacement boards for this purpose. But it's a great spare-parts depot for the right buyer. Even if the boards aren't reliable, they can be used for testing. The switches, rotary encoders, knobs, LCD screen, meter, connectors, cables, chassis, covers and many other parts are fine. Not only that, it has a complete set of optional filters: INRAD 600 Hz, 500Hz and 250Hz. No antenna tuner. $375 plus shipping CONUS for buyer of above radio, $475 plus shipping if bought separately. The optional filters alone are worth a good portion of the price. Save $25 and lots of shipping cost: will pull the front panel and ship with boards if chassis and covers are not desired.

73, Dick WC1M

4737. testing serial communication on orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-25 16:04:32 UTC
From: pa1ap
Topic: 4737 Message: 4737

Greetings,

I am trying to upgrade the Orion 565 and it seems the serial connection is wrong. Not sure about the issue.

Is there a manual / document which describes how to control the rig through serial communication? For example running windows hyperterminal and then type some control commands...

Whats the speed I need to set on the program and are there easy to type commands to get some feedback from the rig?

Suppose the serial port is broken on the set (my bad luck...) any experience repairing this?

Thanks and best regards,
Onno pa1ap

Onno,
In the update window go to settings and go to COM4. This is what my radio needs. You may have to select another COM number from the drop down.

Good Luck,
Earl, K5FTE

I tried all of them, also checked which port it should be, but no result. Also the rig control program does not connect. So it seems to be faulty cable or port. Where can i find which pin is which function on orion (rx/ tx) and if flow control or hardware control is needed?

Thanks and best regards,
Onno

Onno,

Are you using a straight serial cable? Don't confuse it with a modem cable which has a cross over on some wires.

73 and good luck,

John

The port settings for the Orion are 57,600 baud, no parity, 8 data
bits, one stop bit. The host program should be set to use RTS/CTS
signaling. The Programmers Reference Guide is on the Ten-Tec site.

Greetings,

Hope some can provide advice on connecting Heil mic to orion 565.

Already found that the 4 pins plug really needs to provide good ground and I tried to get this done at best way. However i am still having issues with voice communication. ALC is behaving weird, alc led doesnt really acts as expected on peaks (doesnt do much) regardless of speech level. Power goes up and down up to 100watts but i get the feeling rf feedback is occuring. Also through mon i can hardly hear what i am saying through the mic.

Perhaps someone can advice on what to check. Did i miss something on the orion menu's? Is there perhaps a known issue with the orions as produced in 2004?

Anyway, thanks for your help in advance!

best regards,
Onno

Not only do I have a Heil connected to my Orion II, but I also use W2IHY's 8 band Equalizer and Noise Gate as well as his EQplus. They are wonderful additions to any radio but even nicer on this Orion II.

Although I buy and use Bob's (Heil) products, I do not trust his cables. Usually the ground wire is just tucked under the mic connector, plus the Orion cable I received was wired incorrectly, pins 5 (PTT gnd) and 7 (Mic gnd) were tied together. This was the proper wiring for some of the older radios, but not the newer ones. That caused a noticable hum in my audio.

I have one on my orion, using the standard 4 pin mic cable from heil and it
works fine. it has a black color code and is made for the ten tec 4 pin
radios. no problem

Make sure that the mic ground line is not connected to the chassis
ground (or PTT ground line). Doing this in the 565 will produce
distorted audio.

Greetings all,

Thanks for the replies. I learned that my orion does not have the modified mic plug (i measure resistance between ground and pin 2 of connector) and this maybe part of the issue as found. I have send email to ten-tec to ask advice on what to do next.

It seems productions post June 2004 included some modification and pin 2 seems to be connected to chassis. Does someone have more background information on this?

Also is the 4 pin chassis connector something which can be replaced easily for a better connector? In other words is it mounted with a flange and are pins connected with wires going to a pcb board?

Thanks for advice!!

Onno,

Not sure what mic you are trying to connect, however, I have run the Pro set, Pro Set Plus and the PR781 with my OII.

The Pro set and Pro set plus connected without issue for me. The Heil wired PR781 (XLR to 4 pin) was a complete disaster. Heil does some compensatory wiring as noted on their web site which for the Orion was completely contradictory to the mic schematic and the radio's needs.

I would check that if that's what you are using. I re-pinned the Heil cable at the radio side per the TT schematic in the manual and all was fine. Prior to the fix I was getting strange feedback and could also hear a 50KW radio station 20 miles away in my monitor on a key down with no audio. After the mic wiring fix - no issues.

Brad

Greetings Brad,

Thanks for your reply! I am using Handimic pro (HM-PRO) which has 4 pin xlr going into this curly heil mic cable. Indeed several wires were connected in parallel and i decided to take that heil cable out. I replaced by shielded mic cable i had available and each mic pin has its own lead with shield. Connected the mic pin1 and pin 2 to the leads and the shield connected to mic body. Ensured pin 1 and 2 on mic were indeed not connected to shield. Then at the tentec connector I connected pin 1 and pin 2 and shield to chassis....

RF feedback is reduced but not gone. Then I included a feriet clamb and it got better.

What i still notice is the following;

1) Power meter does not follow the audio nicely, it seems to have its own life
2) ALC sometimes works well and then suddenly it completely stops
3) Modulation remains very weak, which might be caused by the mic itself,however on the kenwood ts-2000 it just worked without issue..
4) I MUST use compressor to get ALC active. With compressor off it simply doesnt kick the ALC

I also noticed you need a headphone to use monitor. And even then I have difficulty hearing my own voice.

Seem the mic is not sensitive enough to modulate the transmitter.

Best regards,
Onno, pa1ap

4753. Re: testing serial communication on orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-28 13:12:45 UTC
From: pa1ap
Topic: 4737 Message: 4753

Spoke with the fine people from tentec and there is a high degree of certainty that the max232 [U600] (level convertor chip) is defective. This requires the unit to be returned since the max232 is located on the logic board and component is smd... I have contacted the "local" service center in UK and asked them if it would be possible to ship the logic board only since that would be much easier to do.

Topic and challenge closed... Work in progress to fix the issue... It wasnt the cable, software or human error causing the issue.

Thanks all for all your advice!

Best regards,
Onno pa1ap

4754. Re: RF Feedback hints and tips orion 565 [topic closed]

Yahoo group: orion565 (2009 — 2013)
Date: 2009-01-28 19:33:05 UTC
From: pa1ap
Topic: 4746 Message: 4754

Ten-Tec customer service is excellent. Today i contacted ten-tec uk to discuss shipment of the logic board with defective max232 level converter and while talking the engineer just checked serial number and said he would (with permission of course) take care of RF feedback and revision 2 hw update. The rf feedback requires a modification of the coax cable and/or connector on the logic board. After that modification the engineers said it would reduce or even remove the rf feedback issue.... I have browsed around on the net but not found any reference to this (just curious) but i am sure its in good hands.

Thanks and best regards,
Onno

I am using a PK-232MBX with my Orion for RTTY AFSK. I can't seem to get enough audio out. On 20 meters, for example, the meter shows around the 60-70 watts range, and the ALC light never lights. I have turned the pot on the back of the PK for AFSK level to maximum. I also have set the Aux Input Gain on the Orion to 100, still not enough. Any ideas? Thank you and 73 de...Ralph Gray W9RIG

Why don't you try running FSK? Works great with the O2, and you don't have to worry about setting any audio gain, over driving,,etc etc.

Good luck

Maybe you should check the sound cards WAVE setting. Should be at about 3/4 full or maybe full. Also Mic gain on the Orion should possibly be increased so that the ALC is just glowing. Not good for PSK but ok for the rtty signal. I have no problem with AFSK even though I run FSK on the Orion. A lot easier.73

I have used the Elecraft XV-50 transverter with the Orion. I used the transverter output on the Orion. It worked just fine. The setup for transverters depends on the rf power reqirements for the transverter, what kind of antenna configurations it supports to the transceiver and the control signal requirements. Connecting the XV-50 was not difficult. I used the 28MHz band on the Orion to get the bottom 2 Mhz of the 6 Meter band.

I have used the Orion II to drive Down East Microwave transverters for three years. I drive 50 through 432 Mhz transverters. I us "User 2" to set up the radio for 1 watt out on antenna jack 2. The O II is tuned to the 28 mhz band, which is the IF used on each f the transverters. I use an old Ameritron remote antenna switch to "bandswitch" between the four transverters. The PTT output of the Orion is used to key the transverters. It works very well.

I have used a T-T 6 metre transverter with my 565 in the past and now have an SSB LT-6S. The Ten-Tec transverter used the antenna #2 output while the SSB uses the transverter output. Both work VERY well. The T-T transverter is at 14 MHz and 50 out while the SSB is 28 MHz in and 50 out.

I use(d) the N4PY software to control the transverter and that took care of switching antennas and lowering the power with the Ten-Tec transverter and switching the transverter output and controlling the 6 metre amp with the SSB.

So - very happy.

I would have to ask why you're using AFSK? FSK, which the PK232 does just great, is much superior to AFSK. You don't have audio problems with FSK and it's more efficient as well. Do you ever see 100 watt peaks when operating SSB? I never do, so I don't think you'll see more than what you're seeing now with AFSK. I'm no technician, gawd knows, but one of you who is, might address peak output power on ssb (afsk) for Ralph.

I recommend that you reconfigure your PK232 for FSK operation and you'll then see better power out as well, I suspect.

Go do it Perry, don't walk, run. Seriously though, unless you take your
CW very seriously, it's pretty much complete as is, if you do, by all
means get the 600 and 300Hz filters while you're at it.
I included the 708 desk mike when I got mine about a month and a half
ago, and I love it and the reports it's getting me.
Good luck on your acquisition, you won't regret it.

Should only take a few days if they are in stock Perry. Get the optional filters and the fan if you plan to run real rtty.

It's a great rig. I have never regretted buying mine.

Hi Perry,
I think I received mine within a week or so of placing the order..

Some of the options I would add are;
1. I would buy it with the antenna tuner installed even if you won't use.
First off because the resale value would be higher if you even decide to sell it,
and second because I've been told unless you're really technically inclined
it's not that easy to install in the field.
2. Buy it with all the optional roofing filters included as it will perform
beyond your expectations with all 6 installed.
3. The fan is good if you're going to run RTTY, but I bought it even tho I
don't use it on RTTY alot. $ 35.00 at the time I thought was cheap insurance.

I love the radio, and it hears things my Yaesu 1000 MP Mark V can't. I know
you'll enjoy it also.

Thanks Guys
did not think about a Fan
so I will add that to the list
I dont run RTTY now but maybe I will later

I guess the extra Filters wont add too much more $$$
over a 10 years of owner ship

I Guess I will take my cell phone to work with me Monday and
give them a Call
(Maybe they are open Saturdays ???)

I just seen the web site order page,
that will be the way to go, with my work sked..
My operation here is some CW , mostly 1 to 3 hour sprint type cw
contest. QRP

I work some DX CW on 160 meters , but most of the time is
hanging around 75 in the evening for the two traffic nets at 5 pm
then checking 160 LSB and cw.

4773. Orion 565 VFO knobs (removing them)

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-10 09:16:48 UTC
From: pa1ap
Topic: 4773 Message: 4773

Greetings dear folks,

When I turn the VFO knobs on my transceiver I notice some wearing sounds which indicate the ball bearings might be a bit dirty. To verify I would like to remove the VFO knobs and have a look. Now the easy challenge: what size of hex tool would I need for this? I have tried
all possible hex tools I have in my shack but none fit. Anybody experience with this?

Thanks for advice and best regards,

Onno, pa1ap

p.s. the serial controller has been replaced and the rig is working excellent now..!

Onno,

The hex wrench you need is 0.062 inches. It is mentioned on page 4 of the manual in Figure 1-1.

The wearing sound you hear is probably the drag adjustment for the knob. You can adjust the drag by holding the silver skirt while rotating the knob. That is on page 47 of the manual. Even on the lightest setting I find the drag more than I want so I just loosen the knob and slide it out slightly.

4775. Remotely controlling Orion via internet

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-11 01:06:32 UTC
From: Brad
Topic: 4775 Message: 4775

I have successfully remote controlled my OII using rig control software, skype and Real VNC.

One shortfall in my setup seems to be the ability to disconnect my antennas in the event of any lightning. Has anyone devised a scheme for this or is a simple arrestor such as a PolyPhaser the best possible solution?

A second area of concern seems to be powering on and off the rig remotely. Achieving this is simple, however, is it healthy for the front panel main power swith to be left on and the 13.8v power to be turned on/off, hence powering on and off the rig? Can this have adverse effects on the rig?

Thanks in advance,

Brad

Very cool! Would love to see this documented somewhere on the web if possible -- I'd like to set something like this up on an occasional basis myself.

> One shortfall in my setup seems to be the ability to disconnect my

Well, I will shortly be getting a SteppIR BigIR vertical with full rig interface for the Orion, so in my case I'd just have the vertical element retract all the way to its lower stop, leaving just the radome in the air. You might want to also consider avoiding the lightning issue entirely by installing "sky brushes" like the pros use to keep lightning strikes from occurring anywhere near their towers -- even a stike a mile or more away can
still fry a lot of electronics, even with buried services and a huge grounding buss. Letting the charge "trickle away" will prevent a lightning

strike over a pretty decent area, also protecting your neighbors, even though they won't have a clue about that. ;)

> A second area of concern seems to be powering on and off the rig

Ten-Tec warns not to power the rig on and off by switching the power to the

rig, and advises only using the switch on the rig. However, the switch on the rig is clearly not isolated in any fashion, judging by the huge thump that comes out of the speaker and the spike that travels down the amp relay

cable when the rig is switched on and off with the power switch on its front
panel. I've actually been considering having the switch trip a solid state

relay or something to help prevent any potential issues with such spikes in

terms of the long-term health of the rig. Would appreciate hearing opinions

from others on that subject as well.

- de AF6ME, who got his Orion only a month ago but has been having a
serious
blast with it thus far, and has been attacking the steep learning curve --

worked Canary Islands on 20m phone today with the Orion driving a modified
AL-811 @ 500W PEP out into a Hustler 5BTV @ 8 ft. AGL w/30 elevated
radials,
so I guess I'm doing okay, with a 57 signal report from Africa!

Brad,
I have been using my Orion II remote for two years. Leaving the power switch on and turning the astron power supply off and on remotely has had no problems. To disconnect the antennas I use a serial port switch to control two Ameritron antenna switches. I also use a telephone responder to turn all power off and on.

Greetings Alan,

Thank you for advice. I did see this in the manual but i did not know which one was for the VFO knobs. The challenge for me is those wrenches seem American size and they are hard (impossible) to find in europe... However the good news is that Ten-tec sales has included them in a shipment together with some items I ordered yesterday!

I will indeed the drag and if this is controlled by the distance between knob and frontpanel the solution would be easy. Just making the distance a little bigger to allow the knob to rotate without drag.

Thanks again and best regards,
onno, pa1ap

This sounds like a great project and I know there is lots of interest for this type of operation. Indeed documenting this would be very nice.

On the power cycle challenge I believe the challenge is the initial spike a power supply -might- produce when you switch it on. The psu might burst above 14 Volts or so which might not be the best for any equipment connected to this power supply.

On the Orion power switch the powercycle "plop" is indeed there. I am not sure if regulating this in different ways (using relays) would change that.

On static electricity care needs to be taken for sure. Depending on my shoes while walking through the radio room my esd charge compared to orion ground potential is sometimes enough to trigger the orion in a weird status. Sometimes the PBT/BW LED both light up (and stay up) when i touch the rig. Yes I did create a decent common earth for all equipment but i am not connected to that earth myself.... Just curious.... am I the only operator with static electricity triggering the Orion controls? If so... how the heck do you guys prevent charging yourself while walking over carpet and such like?

So my feeling is that lightning in the area is going to have a blast with the Orion if you are unfortunate enough. This based on my observation with ESD sensitivity.

It's quite humid where I live, so I generally don't have a static buildup
problem like folks do where it gets very cold and dry. I suppose you could

ground the metal parts of your desk, or a plate bolted near your operating
position or something, and discharge yourself to ground before touching the

rig... That might be a bit "shocking", though. ;)

> So my feeling is that lightning in the area is going to have a blast

Another good reason to consider something like "lightning brushes".

http://www.amfone.net/AMPX/114.html

Scroll down about halfway to "LIGHTNING STRIKES AGAIN". I am definitely
going to go this route myself in the very near future... It makes a heck
of
a lot of sense to me, and apparently works really well if the lack of fried

mountaintop microwave sites is any indication at all...

I use an internet based switch, www.webpowerswitch ,to control the on/off functions of the rig (I use an Omni 7) as well as antenna relay switching control. There would probably be an issue with compatibiliy of the voltage and power plug in PA land, though. There has been no problem at all with the radio when switching the 35 amp Astron power supply. For lightning protection I use the gas type discharge units. There is no certain protection against static discharge, however, and even a snowstorm can generate a whopping spark. I do not hook up the antennas in the summer time, when risk is greatest, but it's all a game of chance, I suspect. I plan to put in some coax relays in the spring to provide further isolation, but that probably won't do much other than make me feel better about the risk. The remote has been up over three months now without a glitch.

I would suspect you could just leave the radio on indefinitely, since the risk of humidity building up in a cold radio may be greater than the risk of heat in a radio that is on all the time. On the other hand, the Orions tend to "glitch out" from time to time and need to be shut down and restarted again, and unless you have a way to do that, your remote operation would be temporarily ended...:-)

4789. orion 565 (1) LCD contrast

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-15 18:09:52 UTC
From: pa1ap
Topic: 4789 Message: 4789

Greetings,

I have seen a message on the reflector regarding poor conductivity between lcd screen and logic board. Before taking the unit apart I would like to learn if more orion users have seen the same issue;

1) when the unit is switch-on after a period of no use (next day for example) the LCD contrast starts a little weak and one can see contrast being different on the left side.
2) using the menu contrast function the contrast can be changed to good
3) after 30 minutes or so the contrast becomes over the top and one has to change it back to the level originally set when switch-on

This is very notice-able using release 2 and a lot less using release 1.

Second some advice on lcd screens itself; I have cleaned the lcd screen glass using a goggle cleaning cloth (what one uses for glasses). Could it be that the LCD screen became dirty on the inside (the other side of the glass... facing the lcd elements)? And is it possible to remove the LCD glass, clean it on the inside and then put it back again? Any experience with this?

Thanks and best regards,
Onno, pa1ap

The K5D Dxpedition has really been a great road test for my station. I've had a ball. My set-up with my Ten-Tec Orion, LP-PAN, CWSkimmer and N4PY software (for rig control) has made chasing this one a lot of fun!

On SSB the dual receiver control and display in the PowerSDR panadaptor software enabled me to find the holes and grab the DX. On CW the chaos on 20 metres was visual with the CWSkimmer software and I saw a bit of a pattern and finally slipped in my call. The smooth interaction of ALL that software (N4PY, LP-Bridge, CWSkimmer and PowerSDR) and hardware (Ten-Tec Orion, LP-PAN, and an external sound card) was very satisfying!

Anyway I just wanted to say thanks to Larry (N8LP), Scott (WU2X), Alex (VE3NEA) and Carl (N4PY) for helping increase the ham radio "fun-ratio" in my shack!

73,

Rick

Onno,

I think the main problem is temperature. The LCD does not run well (or at least its optimum bias changes) at low temperature - and the fluorescent backlight may take a while to come to full brightness. The v2 firmware requires a different bias (contrast) setting than v1 for best performance. I don't see any strong left - right difference myself.

I don't think that cleaning the screen helps much. There is no "inside" -- be careful, all the liquid crystals will leak out!

Greetings Martin,

I understand the temperature and its influence on LCD in general. I have made two pictures of the lcd screen with contrast at 99% and 45% to illustrate what I find. if you could check on your unit if you have similar behavior at least I know its considered "normal" :-)

I got an email from another Orion user who replaced a capacitor (it was defective) and A9 power distribution board. He reports he had similar issue and replacing this capacitor fixed his issue.

Thanks and best regards,
Onno

and I uploaded those pictures into the Photos section and you can find
it in the orion 565 contrast album.

Onno,

Your pictures do not come through the Yahoo reflector. You can email me direct - aa6e (at) arrl.net.

Martin

Very interesting. I do not see anything like this.

My screen is mostly washed out at 44% contrast and completely so at 99%. My optimum is about 26%. This is running v 2.062a firmware on an Orion I.

There is an internal bias adjustment that should allow you (and me) to set the optimum close to 50% - which is what you get after a master reset. I have not bothered to adjust mine, however.

I definitely do not see any significant gradient across the screen. Looks like you may have a hardware problem, as you suggest.

From: pa1ap
Topic: 4789 Message: 4796

It would be great if other users could confirm / check too... Any volunteers?

A difference could be that my optimum is set at 50% and hence i can go down a lot more then you can go. In the up direction the same applies but now you can go way above what i can go. Hence it might become fully black.

The capacitors would be C9 / C6 / C7 on the A9 board. Based on his experience this fixed the problem for him. I am not sure but on A9 it seems the higher voltage is generated for the LCD screen light... If that doesn't work well then i guess that could cause a contrast issue.

Best regards,
Onno

Onno I think this would be worth a note to Ten-Tec. Include the 2
photos. This could be a faulty LCD display.

In the interim you may want to try setting "LCD Display" in the OTHER
menu to White/Black and see if that helps your readability.

4800. Re: orion 565 (1) LCD contrast

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-17 07:40:58 UTC
From: pa1ap
Topic: 4789 Message: 4800

I am no expert on how LCD screens typically work but below some findings;

1) I raised the question to tentec service and next day I got a message from them to allow the unit to warm-up and then adjust the portmeter while contrast is set to 50% in the menu... This did make a difference and the screen is sharp again (meaning good bw contrast)

2) The issue reported is visible when there is no light switched on the radio room. This means that the LCD backlight has to do the job to provide the contrast

3) when you have either a TL or light bulb above the lcd screen you dont see the issue anymore.... This because it would provide sufficient light to arrive at good bw contrast... this might be the reason why others dont see the change in contrast when the unit is warming up

To me it seems the backlight might loose power after years of operations, which sounds logical to me.... so then the question is how and if this backlight can be replaced... I carefully looked at the orion video (the tutorial on how to operate) and in the beginning they have a close up of the screen and you can actually see that the contrast on the left is less then the rest of the screen... Little later the lcd screen appears to be "blue-ish" which means they capture the reflection of the TL's above the unit which in effect increase the contrast....

So the magic question to you all; does above make sense and did somebody replace the backlight in the past?

Thanks and best regards,
onno

The contrast of the screen has changed indeed. Its sharper and quicker. Seems to me they optimized the screen code with regards to refresh frequency besides perhaps other performance improvements.

It also means you have to adjust the contrast potmeter as I recently learned. After several contrast changes I decided to take a stepped drill and create a hole at the location of the contrast potmeter for easy access, just like the mic gain potmeter.

Perhaps my perception and not reality but the new firmware also makes the lcd screen temperature sensitivity more visible. I am not sure if thats the LCD screen or the backlight.

Hope this helps, best regards,
Onno, pa1ap

4802. Re: meter wont work properly sticky

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-18 10:27:19 UTC
From: pa1ap
Topic: 4697 Message: 4802

To see if the Orion actually "measures" correctly you could connect the orion to a computer and use a remote control program to check the s-meter output.

If the program is providing proper S-meter levels without the issues you have found then chances are high that the s-meter in orion is defective.

If the s-meter on the remote control program is behaving similar as the problem detected there might be more going on. Then it could be an issue in the AD / DA converter for example.

How did the battery came loose? You really have to use brute force to get that done.... If the unit fell on the ground (while being packed in foam) the accelartion impact might have caused the s-meter to break too....

Hope this helps,
Onno pa1ap

From: qrp2010
Topic: 4803 Message: 4803

I just noticed that the Orion II manual mentions a OTHER menu selection
of line OUT level.

Has anyone found this in a firmware version of the Orion?

Topic: 4805 Message: 4805

Hi there. I'm AF6ME, and I've been really enjoying my 565 (I got one of the deeply discounted refurbs direct from Ten-Tec). It's more radio for the dollar than I could find anywhere else, and I'm very pleased to have it be the centerpiece of my shack.

I've managed to track down some details on how to get the most out of the programmable AGC, and it's a lot of fun to use that to the benefit of weak signal stations.

I've installed what amounts to a foldback in my PA (Ameritron AL-811), so I can run without ALC, but was surprised to not find anything that appeared to be an ALC port from a PA on the rig. I've been reading the manual, but so far have not come across info. Does the 565 not have an ALC port?

Secondly, I discovered today that the sub-receiver is deaf above 12998.60 USB/13001.10 LSB. No s-meter reading above the noise floor once I get to that point. Also, adjusting the BW control for the sub-receiver changes this point (when I increase BW, I can tune higher before losing s-meter reading on the sub-rcvr). I gather this is not normal behavior at all. At first I thought it might have something to do with the fact that the main xmtr and rcvr were in the 20m band and so the bandpass filter for that range was not available to the sub-rcvr. However, switching bands for the main xmtr/rcvr does not affect this issue.

Does anyone know what is going on? Does the rig need to go back to Ten-Tec for something?

Third, I get some intermittent hash and dropouts in the left headphone when the headphone plug is pushed to the side or inserted/removed. It's only on the left side. Rather than try to rip the front panel apart to clean/resolder the headphone jack I thought I'd ask if this was a known issue that is common to the 565, or if I just got lucky. ;) If the former, I would save a lot of time trying to find a fix by asking those who had the problem before me.

Anyone have a source for male 7- or 8-pin DIN connectors? Since I got the discounted refurb unit, it only came from Ten-Tec with a power cord and nothing else at all (an older copy of the manual, but I have the latest one printed out here as well), and I want to work digital modes with the rig. I have gotten several of the 5-pin DIN MIDI connectors I can use for now, but figured it might be good to have the proper connectors for getting the most out of the rig. Looks like I can just direct audio to the left channel, not use FSK, and get everything else I need with the 5-pin DIN connector.

How could I benefit from using the correct 7-pin connector? I could do RTTY without a sound card, probably to better effect than using a soundcard-derived signal, I think. Is there any advantage to having both audio out channels enabled when it comes to digital modes? I will be using HRD and DM780 for my software.

Right now I am also having fun configuring HRD to rig control the Orion. I have a good serial to USB adapter that I've been using, hooked right to the port on the Orion. Can/should I use the aux port PTT line, a rig control TX command from DM780/HRD, or DTS/RTS through the serial to USB adapter?

I would like the radio's current info to be loaded into logger32, but even after configuring logger32 it does not pull the data. This may be because I am also running HRD rig control on one "virtual" serial port. Anyone know if this is possible, if it's a bug in logger32, or what? I would be willing to switch software, but I don't particularly like what I have seen of the built-in logger in HRD. Is there a program with the features of logger32 that can interface nicely with DM780 and/or the 565? I like the features and some of the user interface in logger32, and will just transfer the pertinent stuff by hand if need be.

I've also noticed a few annoying bugs in HRD for the Orion. The FDW, REF and SWR bar graphs in the upper left corner are non-functional. AGC threshold can only be adjusted in 1 uv steps, so I can't fine-tune below 1 uv, meaning I must use the multi knob to make changes. The vu meter reads anywhere from 2-6 s-units high. And switching binaural on in the software does not turn on binaural rx in the phones. However, otherwise it seems to be great software, and it *is* free. I chafe at the thought of paying a huge licensing fee each year for the software that is usually recommended for the 565 (N4PY). Is anything else available that's any good? Does the N4PY software get updated enough with the Orion to make it worth renewing every year, or should I just buy that software and not get any updates, saving the yearly fee? Apparently people have been asking after solutions for some of the Orion problems with HRD for a while and nothing has been forthcoming thus far, so I'm not hugely optimistic that sticking with HRD will end me up with software that works perfectly with the 565.

I also have a SteppIR BigIR w/80m coil coming from SteppIR, with the rig interface installed. I also have a Y cable for the serial port coming to allow the antenna controller to "see" what the rig is doing WRT tuning. I gather that the controller just listens in and adjusts the antenna according to the radio's reporting of frequency. However, I'm not sure if that will dovetail smoothly with rig control through the same port. Does anyone have experience with using a SteppIR antenna with a 565, with or without logging or rig control software? Any advice or info on required steps/mods etc. would be welcomed.

The multi encoder sometimes "slips backwards" when turning it. Is this a dirty pot, or does it signal the encoder is wearing out? It came this way from Ten-Tec, so I should probably contact them ASAP if it is more than a cleaning that is needed.

I think that's about it... Pleased to finally have a top-quality, made in America radio that gets support from the manufacturer. A far cry from previous radios I have owned, and certain Japanese companies who built them. :)

4806. Re: New owner, issues/problems/questions

Looks like the FWD meterin HRD, at least, works; it just refreshes so slowly with the 565 that I rarely see it. :/ What is the speed of the serial port on the 565, and I wonder why HRD is so slow to update...

Also, out of curiosity, what is different with the Orion II? On the face of it, it looks like it's more evolutionary from the 565, and I couldn't justify spending more than twice the money for the Orion II... Is it really that much better than the 565?

I'm sure there will be more questions, but I look forward to learning from all of you who have owned the Orion before. :)

Well, I just tested the sub receiver thoroughly, and it is not working at all. Here's what I wrote to Ten-Tec service:

"The sub receiver will not receive any signals of any kind, no matter how strong. What it does receive is a great deal of hash noise as well as climbing and falling ~6 hz whine throughout its range of tuning, with two exceptions. What is most odd about these exceptions is that their boundaries change if you change the BW setting for the sub receiver. With BW set to 2500, PBT set to +0, and in LSB mode, the dead spots are from 2501.217-4001.217, and from 13001.217 to the end of the tuning range. In these dead spots, I see the same thing I would on the main receiver if I attached the rig to a dummy load; white noise around S1 or below. In no case does the sub receiver pick up any signals at all. Switching the main and sub receivers between the two VFOs has the same effect as switching the contents of the VFOs, so I am pretty sure it is not an issue with one of the VFOs. Both main and sub receiver are set to use Antenna 1, which is the only antenna port that is connected to anything. The main receiver also does not pick up any of the hash and cyclic noise I am hearing on the sub receiver."

The noise goes away if I switch to either of the other two antenna ports that have nothing connected. The "dead spots" have the same signal level as if I was connected to a dummy load, or no feedline of any sort at all.

Has anyone seen or heard of anything like this before? I am assuming there is something significantly wrong with the sub receiver, and since this is really the first time I have tried to use it, I have to presume the rig arrived in this condition (I bought it about a month ago and have been climbing the steep learning curve of my first software-based rig, my first Ten-Tec, and definitely my first Orion, so I don't think it a wonder that it took me a while to find this problem). I hope it is either an easy fix, or that Ten-Tec will take care of me even though the unit is a refurb. If anyone has any suggestions or answers, I'm all ears...

Adam, have you tried a HARD RESET to see if that
resets the SUB RCVR? That's one thing to try.

> Adam, have you tried a HARD RESET to see if that
> resets the SUB RCVR? That's one thing to try.

I have not tried that yet. I am hoping to save that as a last resort prior to sending the rig back to Ten-Tec, as I don't have nearly all the settings memorized, and I don't envy the tedius need to record all those settings before a hard reset to avoid having to figure out my best settings all over again. ;)
Interestingly, after leaving the radio off for a few hours, I powered it back up and magically the sub-receiver was working again. It's slightly more than 2 hz out from the main rcvr, but I was getting comparable signal levels and sensitivity from both. Then I switched VFO A (and the main rcvr) to a different band, and without swithcing the sub receiver and VFO B to that other band, I pressed the A>B button. It faithfully copied the frequency information from VFO A to VFO B, but the sub receiver was still receiving the old band, and I could even tune around in the old band using the VFO B knob -- with the VFO B freq display showing me tuning around, but in the new band from VFO A! When I switched the band select keypad over to VFO B and manually selected the proper band to match what VFO B was displaying, I was back to no signal on receive, just noise, from the sub receiver.
Call me crazy, but this is starting to seem like a firmware bug in its behavior... Some register somewhere is not getting updated properly when VFO info is transferred in that's for a different band, and the processor gets confused about what to do with the conflicting information. That's the only way I can reasonably explain the display saying one thing and the sub receiver piping something else entirely into my 'phones.
Does anyone else have this sort of problem, or has anyone else had it? I am going to try waiting a while, switch the rig back on, see if the sub receiver is again giving the same output as from the main receiver, and then try selecting the band for VFO B before inputting frequency data into VFO B from the band I just selected, and see if that handles the problem. Stay tuned, so to speak...

One known 'bug' is if you put the SUB on AM
and the MAIN on say USB ... the SUB will go
DEAD ... and other such combinations.

Read your manual as to how to load USER1 for
your defaults ... saves you time!

Though it's a bit of a pain, 'flushing the
settings' via the HARD RESET has saved more
than one person shipping a rig back to TT.

Jot down your settings, just to have them,
and they do reload pretty fast if needed.

Interesting, and a bit disappointing that they haven't fixed this in the firmware. From the sound of things, there are plenty of things in the Orion that still could use some work, but I see it's been quite a while now since Ten-Tec released any firmware updates for the 565. I still will feel like I got a good deal on the radio for what it offers, in warts as well as features, but if they are quietly stopping support for the rig simply because they are trying to sell the 566 now, that cautions me against spending big money on another rig down the line... Elecraft's offerings do not meet my operational needs quite as well as Ten-Tec's, but I know the K3 is getting tons of support, updates, etc. to this day. Granted, it's still a current model for Elecraft, but I think it is reasonable that when I spend well into the four figure range for a radio, that it be supported until the bugs are pretty much gone, and definitely appreciate the bonus of new
features added as well. I'll have to see how things go with Ten-Tec's support, both in this particular instance and in general.

Also, I wonder if Ten-Tec would have any interest in releasing part or all of the source code for folks to make their own bug fixes and feature improvements, once they have decided they are not going to offer any more firmware support for the rig? That alone would be enough to save the day IMHO and keep me with Ten-Tec for the long haul, but of course they may well share a lot of code between the 565 and the 566, so they would likely be unwilling to essentially give away their trade secrets. I wonder if anyone has hacked the firmware on the 565 yet, and to what effect?
> Read your manual as to how to load USER1 for
> your defaults ... saves you time!

I already use USER 1 and USER 2 to switch between my eSSB rag-chew settings and my DX settings. I do see where one can choose whether to nuke them or not when hard resetting the radio, but wasn't sure I could keep those settings with a hard reset... I'm also not sure whether some of the settings I am using might be contributing to the problem. I suppose I could do a full-on reset and then slowly start adding back in my settings one at a time and testing to see if there is a setting or combination of settings that is leading up to this problem. I'll also wait to hear what Ten-Tec service says about it before doing anything much more. It does sound like this is either related to or part of the same problem you described up top, though.
Could folks who change bands on the sub-receiver let me know how they do it without killing the sub receiver, so I can at least try that as a workaround? I was thinking of switching the sub receiver to VFO A, changing the VFO B band, and then reassigning the sub receiver to VFO B, if there's any chance that would work.

> Though it's a bit of a pain, 'flushing the
> settings' via the HARD RESET has saved more
> than one person shipping a rig back to TT.

That's good to know, and hopefully I can at least work around this problem and keep the functionality of the rig. I wouldn't be very happy being without my Orion for a few weeks, not to mention the shipping charges from California these days... And I sure hope they will at least consider a bug fix firmware update in the near future, as there are clearly a number of loose ends to be sorted. Even though it's not a current model, it is *my* entry to Ten-Tec, and if Ten-Tec shows me they are continuing their level of service and support for which they are famous then I will certainly be buying more from them as time goes on. :D

> Jot down your settings, just to have them,
> and they do reload pretty fast if needed.

Yep, just have to slog through and do it. If I was more familiar with all the settings and how I had them set up to work for me it would probably seem less onerous. Oh, well, I'll consider it part of my learning curve, I guess...

I had a problem which sounds similar. I thought it was firmware but it turned out to be a "synthesizer out of spec," in my mind a synthesizer broken. The subreceiver could be near where it was supposed to be, or it could be 100 kHz away, or it could be MHz away and actually not tunable. I saw a small number of similar reports several years back. Most had the same cause as my problem. Ten Tec fixed things quickly-in my case under warranty. Let us know what you find out.

> Let us know what you find out.

Turns out the resolution was almost what had been suggested before with the reset. I'd tried a Master reset, twice, once with and once without user memories. I received an email this morning from Paul, head of Ten-Tec service, where he recommended a RAM reset followed by a full Master reset with filter and user memory settings reset as well.
I wasn't previously aware of the RAM reset, which is done by powering up the rig while holding down the LCK button for VFO B, and continuing to hold it until the reset message was displayed at the bottom of the screen. Then a regular Master reset as mentioned in the manual and previously in this thread, and answering YES for both user memory and filter reset, and all was right as rain.
It's awfully strange listening to both rcvrs tuned to the same frequency with the 2 hz discrepancy between them. Even weirder is listening to them in stereo, one in each ear. :)
But the sub-receiver is working again, which is my main concern. :D
Now, if we can convince Ten-Tec to keep working on the firmware for us, or to release some or all of the source code so we can make our own changes if they don't want to continue offering bug fixes and upgrades themselves... Does Ten-Tec read this group? :) One would hope so...

Update: Well, it was "fixed" for all of about 15 minutes. The behavior of the sub-receiver is increasingly erratic; sometimes it will work for a while after the rig has been shut off for at least a few hours, usually it won't. Once it worked fine in AM mode, but would only receive what sounded line a 1 khz roofing filter on a SSB signal which would disappear entirely when the sub receiver was tuned onto the correct dial frequency for the USB transmission!

I've resigned myself to this being some sort of a hardware problem and the rig having to go back to Ten-Tec. Waiting now to get the green light to ship back to them. Guess it's back to using the TS-520S for a while... ;) I will certainly miss the Orion while it is gone!

Adam, the Orion appears to be very sensitive to the supply voltage, and has been known to exhibit some strange behavior if it is not adequate. Before sendint the unit back, I would recommend taking a look at the power connector. Make sure that the contacts are clean, and that the split male ends have not compressed, causing the connector to be loose. Also, pull the fuse, and clean the contact surfaces. There is an article on the Ten Tec Wiki at www.tentecwiki.org/doku.php?id=565pwrconn <http://www.tentecwiki.org/doku.php?id=565pwrconn> that you may want to read, entitled 'Orion 565 Intermittent Power Connector Fix.'

Now if only we could get some more bug fixes for the 565, or at least release of the source code so those of us with the potential ability to modify and compile the firmware would have a chance to enhance/improve/bug-fix the 565 some more... After almost 2 years without a firmware update, I get the feeling there just aren't going to be any more...

4820. What are you using foi rig control?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-27 02:40:30 UTC
From: Adam Wade
Topic: 4820 Message: 4820

As a relatively recent convert to Ten-Tec via the direct purchase of a factory refurb Orion, I've been facing the steep learning curve, and thus far coming out on top. :D I've gotten custom AGC settings down fairly well, I've gotten programming and setup well dialed in, and I have my audio front end all set for good signal reports and good audio quality.

I'm ready to get back into digital modes, using the 565 this time. However, I've found that there are some fairly big bugs still in Ham Radio Deluxe for the Orion, and it appears as if Simon Brown does not have ready access to an Orion to correct those bugs and provide full support (and I imagine he probably doesn't have a lot of time for it, either!).
So what are you guys using for rig control for the Orion? HRD's interface is not at all bad, and I am very fond of using DM780 for digital modes, thus HRD is the natural solution due to how integrated DM780 is with HRD for rig control and so forth. Things like quick filter setting changes, though, seem to be a little awkward for the Orion in HRD, which would be a bit of a handicap.
The other popular software seems to be N4PY's software, but the user iterface does not appear to be as nice, configurable or flexible as HRD's; I'm also a bit put off by having to pay a fairly steep licensing fee every year to keep support going. Is there any point to the yearly fee? Does the Orion version of the software get updates and so forth often enough to justify the cost of the yearly licensing fee? Is the software good, and what are its flaws as compared against HRD? Can it interface nicely with DM780 or other digi-modes software?
Are there any other options that I'm not covering here? I certainly don't mind buying software for the radio if it works well, is supported, and has a comfortable and intuitive (or at least heavily customizable) user interface. If it's no better than HRD, though, I would be hard pressed to spend a lot of money when HRD is available at no charge. Opinions are certainly welcomed on this one. My primary interests are in digi-modes, with potential bonus points for things like rapid rig control for lightweight contesting and/or interfacing directly with some sort of full-featured logging software (I like the features and interface of logger32 pretty well for right now, and my initial look at HRD's logging app makes it seem like it is very thin on features like call lookup, awards recordkeeping, prefix country info, gray line indication, output for LotW upload, etc.).

It was a brand-new power cable and a fresh rig from Ten-Tec's refurb. I checked the connector on both sides, brand shiny new by all appearances. I snugged the female sides, I replaced the soldered spade lugs for the power supply end, and I replaced the fuse (fuse connectors on the rig look perfect, but the fuse was less than stellar-looking, but without any indication of high resistance. I even tried turning the power supply up to 15 volts and doing repeated resets. Nothing changed with the sub receiver problem -- it still is apparently not receiving anything at all.
> There is an article on the Ten Tec Wiki that you may want to
> read, entitled 'Orion 565 Intermittent Power Connector Fix.'

Read it with interest. Notably, the rig is having no other problems at all of any sort EXCEPT the sub receiver -- all the filters are working, no display flicker, never rebooted itself or locked/hung up... The fact that the problem is somewhat varied but is ONLY in the sub receiver leads me to believe it's very litely an issue with poor connections/v+/gnd on the sub receiver itself, but since the rig has a very limited warranty due to being a refurb I am very concerned about missing out on the window for getting Ten-Tec to take care of it -- I imagine they probably charge $60-70 per hour, and I don't relish freight both ways plus labor plus being without the radio for probably a minimum of 2-4 weeks when the problem seems to have been there when I got the radio from Ten-Tec. I guess we will see... Still waiting to hear back from them on whatever comes next. I'm not afraid of getting iniside the radio, I'm just not sure I know my way around the
iniside of the rig well enough to be able to zero in on the sub receiver's hardware and board(s) to look for connector issues.

Well, I could just kick myself.

I suppose it was a combination of "I've never done it before so obviously I don't know how to do it" combined with "I just spent a pile of money on this thing, I'm scared of screwing it up". :D

Finding the sub-receiver was a piece of cake (it's even laid out conveniently in the back of the manual exactly where each board in the radio is), and then it was a pretty simple matter of fiding the loose mini-coax connector and making sure it had a solid connection (I'm banking on the ground side having the problem, based on the strange behavior, but it's hard to be sure).
Now everything appears to be 100%. I'm going to keep an eye on it and make sure everything works as it should over time, but when I plugged the power cable back into the rig, fired it up, and the sub receiver was working properly from switch-on without having to do any resets, I was pretty sure I had sussed the source and gotten it licked.
Sometimes you just need to forget your internal bull!#%#%& telling you that you don't know your way around in there so don't go poking around, and remember that you know a lot of basic electronics and electrical/electronic troubleshooting from decades of career experience and that it's not really a hell of a lot more complicated than anything else you've ever worked on. Never mind that my main experience was with motorcycles, and with automotive and motorcycle fuel injection... Ohm's Law and the behavior of basic circuits in real-world operation remain the same, from a simplest knife switch to the most confounding computer. :)
Thanks for bearing with me on this no-brainer, everyone. :D

Hello to the list,
Anyone using this combination? ALC connection necessary?

I am currently using the Ten-Tec Centaur amplifier with the Orion.

Any observations appreciated.

Hi Barry, download and install the update, then look in C:\Program Files\Ten-Tec\OrionII Firmware Update on your PC's hard drive ... you should find the details on the update in one of the PDFs.

Not using that combination, but as near as I can figure, there is no ALC connection on the
Orion. I have my Ameritron AL-811 modified with AK6G's mods, which include a negative RF
feedback resistor that elimiates the need for ALC and prevents overdriving the amp by the
rig. The Orion manual claims the Orion requires no ALC feedback from an amp, but how they
avoid overdriving amps that cannot handle a full 100W of drive I do not know.

I use N4PY. The price is fair for the performance. Much easier than
using the front panel of the radio.

For digital try DXLab Winwarbler. That one's free.

4829. Orion II - 2.041 XL - Possible Bugs?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-02-28 00:53:59 UTC
From: Brad
Topic: 4829 Message: 4829

I played with the Beta firmware for some time and note the following:

The following observation is for RF AGC:
I use AGC threshold to set (V2.039) the the background noise quiet on the rig. I usually set AGC to ~1-2 S units above the noise level to quiet things down. In doing this, the S meter usually moves up/down as AGC is increased/decreased. I have changed bands a number of times now with 2.041XL and the S Meter just wont move when adjusting AGC. Getting out of the menu and going back in seems to fix this issue. I note that it seems to happen the most when going from a band to 20m but have had it happen on other bands. No idea what band would even have to do with things...

The following observation is for AF AGC:
Is it me or does it sound like CW is in a tin can - very "clicky". AGC settings used were the same when switching from one to the other types of AGC. Audio levels to the headset seem way down in AF AGC - not even exercising the AGC system.

Anyone else experiencing the above?
Who does this report go to at Ten-Tec?

Brad

Brad,

I've also been playing around with the new version:

RF AGC: I am unable to replicate your observations regarding
the S meter (S meter will still move up and down with AGC
threshold adjustment).

AF AGC: I am hearing the same things you are,
think I'll stay with the RF AGC.

Have fun,

Marc WC1X (4Z8BB)

I have an O II with an AL-80A. Neither Orion has an ALC input. In the days of ALC, we could all simply crank everything fully clockwise and go about our merry way. Not any more...

Besides, you will have difficulty over-driving al AL-82 with a 100 W rig: two 3-500Zs in GG require can easily handle 100 W of drive and then some without being over-driven.

In general, with the O or O II simply provide the Orion with a two-tone signal from something like a sound card (my PSK program does this nicely) and adjust Orion the output to where it needs to be to drive the amp properly. Orion output is essentially controlled by ALC -- simply make sure that you don;t have the mic gain cranked wide open and you'll be good to go.

I use DX4WIN general logging software, and WriteLog for contesting. Both of these use MMTTY as a plug-in for RTTY operation. PSK-31 is another program, I forget which. These combinations do all that I need to do for DXing and contesting.

Sent: Thursday, February 26, 2009 8:41 PM
To: orion565@yahoogroups.com
Subject: [orion565] What are you using foi rig control?

As a relatively recent convert to Ten-Tec via the direct purchase of a factory refurb Orion, I've been facing the steep learning curve, and thus far coming out on top. :D I've gotten custom AGC settings down fairly well, I've gotten programming and setup well dialed in, and I have my audio front end all set for good signal reports and good audio quality.

I'm ready to get back into digital modes, using the 565 this time. However, I've found that there are some fairly big bugs still in Ham Radio Deluxe for the Orion, and it appears as if Simon Brown does not have ready access to an Orion to correct those bugs and provide full support (and I imagine he probably doesn't have a lot of time for it, either!).
So what are you guys using for rig control for the Orion? HRD's interface is not at all bad, and I am very fond of using DM780 for digital modes, thus HRD is the natural solution due to how integrated DM780 is with HRD for rig control and so forth. Things like quick filter setting changes, though, seem to be a little awkward for the Orion in HRD, which would be a bit of a handicap.
The other popular software seems to be N4PY's software, but the user iterface does not appear to be as nice, configurable or flexible as HRD's; I'm also a bit put off by having to pay a fairly steep licensing fee every year to keep support going. Is there any point to the yearly fee? Does the Orion version of the software get updates and so forth often enough to justify the cost of the yearly licensing fee? Is the software good, and what are its flaws as compared against HRD? Can it interface nicely with DM780 or other digi-modes software?
Are there any other options that I'm not covering here? I certainly don't mind buying software for the radio if it works well, is supported, and has a comfortable and intuitive (or at least heavily customizable) user interface.

If it's no better than HRD, though, I would be hard pressed to spend a lot of money when HRD is available at no charge. Opinions are certainly welcomed on this one. My primary interests are in digi-modes, with potential bonus points for things like rapid rig control for lightweight contesting and/or interfacing directly with some sort of full-featured logging software (I like the features and interface of logger32 pretty well for right now, and my initial look at HRD's logging app makes it seem like it is very thin on features like call lookup, awards recordkeeping, prefix country info, gray line indication, output for LotW upload, etc.).

Thanks for the feedback. I went back in this morning to replicate
the problems I saw with the S-meter and AGC threshold settings and
still have the issue. Bottom line - setting the threshold is working
fine but the meter gets stuck when going into the menu screen.
Backing out and going back in seems to get it unstuck.

Maybe I need to try a reset.

Brad,

Had the same problem this morning.
S-Meter stuck at about S-7 and didn't move
with RF gain setting. tried both AF and RF AGC with same results.
I did a master reset and the S-Meter went back to working.

So far I am under whelmed by the changes. When I get a chance
to work with it more I will put in my thoughts on the changes.
One thing I do miss is the frequency scale at the bottom of the
band scope and the waterfall display is useless.

WELL THE FIRMWARE 2.041 XL IS WORKING SO FAR WITH MY ORION
II. NO S METER HANG UP YET EVEN SWITCHING FROM AF AND RF GAIN

SETTINGS. INSTALLED ON 02/2709 AT APPROX 1700HRS. HAVE SHUT DOWN THE ORION II A FEW TIMES TO SEE IF THE RIG WOULD ENCOUNTER ANY PROBLEMS. SO FAR ALL IS GOOD.

(1) IT WAS NICE THAT TEN-TEC MADE THE SCOPE A LITTLE BIGGER AND ADDED SOME COLOR WITH THE WHITE BASED ON THE MENU SETTING FOR THE LCD DISPLAY.

(2) BUT WHAT HAPPEN TO THE FREQUENCY SCALE. THIS IS A POOR DESIGN BY TEN-TEC. BEFORE I WAS ABLE TO TELL HOW WIDE ANOTHER HAM WAS BY THE SCALE. YES IT WAS NOT LIKE USING A FLEX 1000 OR 5000 BUT IT WAS FAIRLY ACCURATE AND WORKED.

(3) THE WATERFALL DISPLAY IS ANOTHER POOR DESIGN BY TEN-TEC. YOU CAN SEE THAT IT IS A BLACK AND WHITE PIECE OF VIDEO THAT SCROLLS AND YOU CAN SEE WHERE IT IS PIECE TOGETHER LIKE A PIECE OF PAPER. I THINK IT IS USELESS AND WOULD NEVER USE IT.

(4) THE RF AND AF AGC SETTING SEEM TO WORK SO FAR. RF AGC NORMAL OPERATION AND THE AF AGC SETTING REDUCING NOISE, BUT SIGNAL FOR EXAMPLE IF YOU ARE LISTENING TO A 59 SIGNAL THE SIGNAL STAYS THE SAME. IT DOES REDUCE ALOT OF NOISE BUT NOT SIGNAL. THIS IS A GREAT TOOL WITH A WITH NOISY BAND CONDITIONS. I DID FINE THAT I HAD TO INCREASE THE AF GAIN LITTLE WHICH IS NO PROBLEM. THIS UPGADE FROM TEN-TEC IS A GOOD ADDED TOOL USING YOUR ORION.

(5) THE SCOPE CHANGE POOR. GIVE ME THE OLD ONE BACK OR IMPROVE THE NEW ONE INCLUDING THE WATERFALL. AF AND RF AGC SETTINGS VERY GOOD SO FAR. STILL HAVE TO PLAY WITH NEW VERSION TO SEE IF I ENCOUNTER ANY OTHER POSSIBLE BUGS.

Topic: 4820 Message: 4836

Consider the DXLab Suite, which supports your Orion 565 and is free. Defects are generally corrected within 24 hours; the current open defect backlog across the entire Suite is 2.

Besides the usual transceiver control, logging, DX spot collection and digital mode features you'll find in most applications, DXLab

- displays settings for frequency-dependent devices like tuners and amplifiers, and can control external devices like antenna switches

- provides 10 banks of 10 frequency memories, with the ability to continuously scan the frequencies a in a bank

- lets you define up to 16 user-defined command sequences and 8 user-defined "sliders"

- directly prints QSL labels and 4-to-a-page QSL cards

- directly prints addresses on envelopes or labels

- tracks confirmation and verification of QSOs for DXCC and TopList awards, highlighting needed DX spots, automatically generating outgoing QSLs that request confirmation of needed QSLs, identifying confirmed QSOs for submission to the ARRL DXCC desk, and generating DXCC submission paperwork

- reports progress towards DXCC, TopList, Challenge, VUCC, Marathon, WAS, WAC, IOTA, WAZ, WPX, ISA-CA, DOK, WAE, RDA, JARL, and WAB awards

- extracts address information from all 3 CDROM callbooks and QRZ.com (no advertisements for subscribers, with advertisements for non-subscribers)

- provides operations that can alter many logged QSOs simultaneously without requiring the user to modify ADIF files -- e.g. performing callbook lookups on already-logged QSOs, or adjusting the start times of QSOs logged during a specific time range, or extracting QTH information from COMMENT fields, or...

- synchronizes with LotW and eQSL.cc, initiating upload and download operations with a single mouse click without requiring the user to manually invoke TQSL

- provides one-click access to more than 80 web-accessible sources of QSL information

- provides both map-driven and callsign-driven operation of all known PC-controllable rotators

- captures DX spots from up to 6 sources (telnet clusters, packet clusters, DX Summit), creating and maintaining a local database with one entry for each active DX station that is color coded by "need" and LotW participation, and whose entries can be independently filtered and displayed in a table, on its world map, and on a zoomable bandspread

- extracts QSX frequencies from DX spot notes, enabling accurate transceiver setup for split frequency operation with one user action

- captures solar and geomagnetic data from WWV spots and uses this data to display easy-to-understand QST-style graphical propagation forecasts, and to depict the auroral oval on its world map

- monitors user-specified NCDXF/IARU HF beacon schedules to rapidly calibrate propagation forecasts with actual propagation

- decodes all PSK31 or PSK63 or PSK125 QSOs within your transceiver's bandpass and extract callsigns to create and maintain a "stations heard" window

- simultaneously runs soundcard RTTY (using the MMTTY engine) and an external modem (e.g. a KAM or PK232) to provide diversity decoding or the ability to simultaneously decode a DX station and callers

- supports PSK, RTTY, CW (generation only), and Phone (voice keying) with a single user interface and macro facility

- interoperates with with MultiPSK, MMSSTV, MMVARI, MMTTY, MixW, Fldigi, DM780, HRD, and DX Atlas

- is updated frequently, and downloads/installs upgrades with a single mouse click

- is driven by an active and friendly user community open to everyone

The DXLab Suite is available via http://www.dxlabsuite.com/

> As a relatively recent convert to Ten-Tec via the direct purchase of a factory refurb Orion, I've been facing the steep learning curve, and thus far coming out on top. :D I've gotten custom AGC settings down fairly well, I've gotten programming and setup well dialed in, and I have my audio front end all set for good signal reports and good audio quality.
>
> I'm ready to get back into digital modes, using the 565 this time.

However, I've found that there are some fairly big bugs still in Ham Radio Deluxe for the Orion, and it appears as if Simon Brown does not have ready access to an Orion to correct those bugs and provide full support (and I imagine he probably doesn't have a lot of time for it, either!).
> So what are you guys using for rig control for the Orion? HRD's interface is not at all bad, and I am very fond of using DM780 for digital modes, thus HRD is the natural solution due to how integrated DM780 is with HRD for rig control and so forth. Things like quick filter setting changes, though, seem to be a little awkward for the Orion in HRD, which would be a bit of a handicap.
> The other popular software seems to be N4PY's software, but the user iterface does not appear to be as nice, configurable or flexible as HRD's; I'm also a bit put off by having to pay a fairly steep licensing fee every year to keep support going. Is there any point to the yearly fee? Does the Orion version of the software get updates and so forth often enough to justify the cost of the yearly licensing fee? Is the software good, and what are its flaws as compared against HRD? Can it interface nicely with DM780 or other digi-modes software?
> Are there any other options that I'm not covering here? I certainly don't mind buying software for the radio if it works well, is supported, and has a comfortable and intuitive (or at least heavily customizable) user interface. If it's no better than HRD, though, I would be hard pressed to spend a lot of money when HRD is available at no charge. Opinions are certainly welcomed on this one. My primary interests are in digi-modes, with potential bonus points for things like rapid rig control for lightweight contesting and/or interfacing directly with some sort of full-featured logging software (I like the features and interface of logger32 pretty well for right now, and my initial look at HRD's logging app makes it seem like it is very thin on features like call lookup, awards recordkeeping, prefix country info, gray line indication, output for LotW upload, etc.).

Tried the master reset and no luck. AGC S-Meter response still erratic when adjusting threshold level by watching the s-mater. Does not happen every time but when it does it is a pain to push a bunch of buttons to get it to free up.

Noticed another issue when in AF AGC today:

Pushed the notch button by accident while in CW mode and I got what was something that sounded like a frypan - buzzing, crackling, popping. Only thing that would stop it is to switch back to RF AGC.

Tried notch button in RF AGC for kicks - no problems.

Just loaded 2.039 back in with no AGC probelms so I deduce 2.041XL Beta has issues.

I really wonder how much Beta testing TT did of if this release is truly their Beta test.

Brad

Well, it does say 'beta' next to the download on their web site. I
gather the final version has yet to be posted.

From: w0ewm
Topic: 4840 Message: 4840

The following note is part of the documentation on the AF and RF AGC facilities.
73, Merle - W0EWM

"To support this feature, it was necessary to modify the DSP code and boot system to allow the radio to

contain 2 full versions of the DSP code. This was required because the DST's are fully loaded, firmware

wise, and did not have room to store both AGC algorithms.

To select between Audio and RF AGC, a menu items has been added to OTHER MENU. The choices are

AF AGC and RF AGC. This selection can be changed at any time but will not take affect until the radio's

power has been cycled."

4841. Firmware upload PROBLEM 566

Yahoo group: orion565 (2009 — 2013)

I have a big problem and TenTec is closed untill monday.
I have tried to upload the newest firmware on friday for the Orion II. As I did it took forever to upload the firmware (6 lines per minute). I called tentec and they told me it could be a problem with my COM ports. I reinstalled windows XP in the computer just to make sure. Just the same. I switched com ports.... just as slow. I bought a USB-Serial cable and connected it to the computer... Nothing. SLOW AS HELL. I got my laptop and connected the USB cable to the Laptop just to make sure, the same just as slow.
Now I have no big hurry, but what happens is that after about 2-4 hours of uploading the firmware (and I think it is uploading since in the radio it appears program flash and the progressing numbers), the program justs stops, and the progress stops as well.... never gone further than 500.... so what can it be? I cant seem to understand.

PLEASE HELP the radio is as for now DEAD.... just FLASH UPDATE MODE.....

BTW at the start of the firmware program it says that the communication of the radio is not possible..... If I click on OK than the radio starts by Erasing Flash, and then it goes to program flash, I supose that the communication si fine..... isn't it?

1. Be sure you have the speed of the port set to 57600 bps
2. Try another USB to Serial adapter.

Thanks to everyone for their replies thus far. I've been doing a lot of research, have installed and am working with the steep learning curve for the DXLab Suite (is there a good place to go for getting assistance setting it all up? I'd rather not clog any mailing lists with questions, but especially if there is somewhere that shows how various people set up for various rigs and operation situations I would find that immensely useful).

By way of comparison, my yardstick thus far was using HRD with an FT-100D, which was my last microprocessor-driven rig. I was able to access everything I needed on the rig quickly via the on-screen interface, and many features could be accessed much more quickly than via the front of the rig itself.

Thus far, it appears to me that maybe the N4PY software gets me closest to that yardstick, after reading most of the manual for the software. I REALLY wish I could demo it somehow before buying, but it certainly looks to be a complete and full-featured product, with a great deal of thought put into making it fully functional and having a lot of nice features built in that you simply can't get from any radio's front panel. Can any users comment on how often the software is updated at this late stage for the original (565) Orion? My sense is to spend the $65 for the program but not spend the money for the yearly update charge, as I'm thinking that the software is unlikely to be developed much further than it already has, and I am sure that the bugs have been worked out as much as they will be.

I do have to say I'm really liking the DXLabs setup for chasing DX off of clusters. I may use it just for that purpose. I'm not all that excited about direct rig control with it outside of using it to set the VFOs and mode, but that may be due to my lack of understanding of how to configure Commander at this point. But for DX spotting via multiple clusters, it's amazingly full-featured and handy, not to mention configurable. And I am also liking the features of the logging software as well. One question there; I especially like that in logger32 each logbook entry is color-coded based on whether I need to send a LotW or paper QSL, whether I've received a paper QSL, and whether I've gotten a LotW confirmation of the QSO. I don't see right off where I can do that sort of color-coding of the actual log register, and that's the one thing I'd like to have that I don't see right off in the logging software in DXLabs Suite. Can that be configured? Feel free to answer that one off-list since it's not really on topic for this group.

One thing I have noticed with the Orion is that the polling rate seems to be very slow compared to, say, my FT-100D, and that seems to be a limitation of the radio's internal serial port hardware/interface. Is there anything I am missing there, or is that just as good as that gets? I'd love to have a configurable panel on my monitor that gave me ready slider-based access to all of the things on the Orion I like to adjust (especially having quick access to the programmable AGC adjustments) plus quick and easy scalable tuning (a combination of HRD's band-based sliders and DXLabs' Commander's switching of main and sub receiver to allow quick tuning of any frequency without having to manually choose the sub receiver for non-Amateur bands would be made of win for me), but it seems like for rapid adjustments to the rig I am truly best off using the front panel rather than running the rig exclusively from my computer screen. And in a perfect world, I'd not be using half a dozen different programs, each one for a particular use (contesting,

chasing DX, running digital modes) with the attendant potential expense and learning curves, plus much software to maintain -- 1 or 2 apps for a given area (i.e., for rig control, for logging, for digi-modes each) would be by far my preference, so I only have to learn one or two apps, only have to maintain one or two apps, etc. for a given activity (logging, driving the radio, handling digi modes). I welcome anyone whose experience shows that it really is a benefit to run more software than that more tailored to each focus of opertion to share their experience with me to help me understand how and why that might be better.

Looks like a lot of steep learning curves ahead. :) Thanks for your experience and the time spent sharing that with me.

The Orion 565 is now pretty "mature", IMO. Updates will address some remaining bugs and polish some features, but won't revolutionize the radio. I wouldn't expect a v. 3 firmware, for example. (But I'd like to be proved wrong.) That's a separate issue from the question of control software. Personally, I would be glad to pay a small annual fee to keep the software developer well motivated to maintain the software and fix bugs. For example, to keep up with new PC operating systems, etc. There is such a thing as bit rot.

You are right that the serial port control of the 565 is not fast enough to fully emulate the "look and feel" of the front panel. It was not really designed for fast interactive control. In fact, there are several front panel controls that cannot be overridden from the serial port at all (band stacking regs, auto antenna selection, some audio settings, etc.), and that's a nuisance.

The N4PY software does a surprisingly good job, however. Considering the hardware limitations, it does give you a reasonable illusion of "being there". But it won't satisfy everyone.

4850. Re: Orion I and Ameritron AL-82

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-01 22:17:19 UTC
From: k1fpv
Topic: 4823 Message: 4850

I have my Orion II driving an AL-82 and with 100 watts. On all but 2 bands, I can get 1500 watts out. I have no ALC hookup and the 100 watt rigs probably don't produce enough signal to require ALC if the audio gain isn't too high.

I have an AL-811 I use as a backup amp that is using 3 572B's in it and I just reduce the drive to 40 watts or less when using that amp....again without any ALC. I consistently get good audio reports. I wouldn't worry about not using the ALC.....just keep the drive down.

Just be sure that it is a straight serial cable. The modem cable can have the pins crossed. There is also a null-modem cable with pins crossed. It is just an idea since you had trouble with both computers. I use a USB to serial adapter and the cable that came with my Orion. I had trouble with an upload awhile back and found that by powering down the computer and then restarting cured the problem. Have you looked at your system hardware to be sure you are using the correct port? If you are using XP, go to Start, right click on My Computer and select properties. Under that you should find a hardware tab. Look at the serial port. It will tell you what port it is. If you are using a USB to serial adapter, this is the only way to be sure you have the correct port. Years ago, I had an IBM laptop that had the infra-red adapter. If it was enabled, that disabled the only serial port. Look at the hardware list and see if anything has a yellow symbol in front of it. That means that something is not working correctly.

Good luck and 73,

John

Been working my way through that. I wish it was more readily searchable (like a compiled HTML document or a PDF) so I could skip clicking through a lot of the basics to get right to the meat of what I am looking for, but any help is better than no help. :D I guess it'll just take some time, I just have to set some aside for getting everything understood and set up. I can't afford to have to do that with 10 pieces of software at this level, though... More investment than I'd like to make, and I suspect I can get what I want out of rig control without having to take that much time reading manuals and adjusting settings. :D

From: James Streible
Topic: 4829 Message: 4854

I was checking out the new firmware 2.041XL this weekend and had a strange think happen.

The band scope background turned solid red and the signals were still showing in white, as normal, on top of the red. The red background began to break up into vertical strips that looked like a picket fence. About the time it was ready for the last narrow red stripes to vanish it would re-sweep and the entire scope background would be a solid red again and the whole thing would repeat. This continued for some time. At first I thought it was caused by lightning crashes. However, I went to a dummy load and turned the RF gain all the way down and it still continued. I tried both RFand AF AGC without any change. Nothing seemed to effect the way it behaved. Finally, I turned the Orion off and waited about 30 seconds and turned it back on and everything was normal. It has not happened again. Go figure!

Some other observations, they can take out the AF derived AGC and the waterfall display and give us back the frequency scale and selected sweep ranges. Also, I think the band scope height could be reduced by about 1/4 inch and make the display for the bandwidths close to their old height.

Hi James

The ''flame red''? sweep disappears when you press the sweep off and on.
It happens all the time ,I've seen it several times.

Also notice that:
Change to AF AGC and press NR and then Notch.
Wait a while and you will have an audio crash.You will hear only ''white noise''.
Change to RF AGC and everything is fine ,the audio comes back.

These 2 are well known bugs of this beta release.

Fotis,

Thanks for the info.
I have not had the audio crash yet as I have
not set up the procedures as you described them.

A side note; if you have 3x 811A/572B tubes in your amp, it's an AL-811H; the AL-811 has a pair of 811As and is rated at 600W PEP max. Max drive rating for the AL-811 is 70 watts PEP; are you running a higher duty cycle mode than SSB? 40 watts sounds extremely conservative to me, especially with 572Bs installed, whether you have ALC or not. You might also want to consider installing an AG6K kit with anode protection fusing, grid protection fusing, improved low-Q VHF parasitic suppressors, and perhaps most importantly, negative RF feedback. The last will preclude the need for ALC, allow you to drive the 811 with a full 100 watts without overdriving the amp, and responds much more quickly than ALC can, doing a better job protecting the amp. I've installed his stuff in my AL-811, and it has all been working wonderfully for me. :)

Just for the record, the "side note" in the quoted post below is not accurate. The factory stock Ameritron AL-811 is fitted with three (3) 811A's and the factory stock Ameritron AL-811H is fitted with four (4) 811A's.

572B's can indeed be directly substituted in these amps and will give you a little cushion in anode dissipation - but - ultimately, the power output is limited in each amplifier by the power supply. Don't expect any more power output by making the substitution. If you drive the "wee" out of them, the 572B's should hold up better and may give you a little more peace of mind! Then again, why not just run them in spec? No one on the other end is going to notice the difference unless they are using lab instruments under controlled conditions. As usual, YMMV! > wouldn't worry about not using the ALC.....just keep the drive down.

A side note; if you have 3x 811A/572B tubes in your amp, it's an AL-811H; the AL-811 has a pair of 811As and is rated at 600W PEP max. Max drive rating for the AL-811 is 70 watts PEP; are you running a higher duty cycle mode than SSB? 40 watts sounds extremely conservative to me, especially with 572Bs installed, whether you have ALC or not. You might also want to consider installing an AG6K kit with anode protection fusing, grid protection fusing, improved low-Q VHF parasitic suppressors, and perhaps most importantly, negative RF feedback. The last will preclude the need for ALC, allow you to drive the 811 with a full 100 watts without overdriving the amp, and responds much more quickly than ALC can, doing a better job protecting the amp. I've installed his stuff in my AL-811, and it has all been working wonderfully for me. :)

D'oh. Talk about a brain fart... And I was just inside my AL-811 a few weeks ago. Whoops. I knew that one. Chalk it up to not getting my Mirapex on a regular enough basis. :/
> 572B's can indeed be directly substituted in these amps and will

Yep, absolutely correct. With additional power supply voltage you can get a lot more out of a 572B than an 811A, but without changing the power supply you are essentially just insuring that you're less likely to wreck the tubes if you make a major mistake.
> Don't expect any more power output by making the substitution.

Also agreed. Was this comment in response to my comment? I never suggested you could get any more out of an 811A or a 572B in a grounded-grid amp designed for 811As. I was suggesting that using negative RF freedback would provide better protection against overdriving the amp, and the attendant splatter, and would allow pretty much any drive level without an ALC connection without any worry about overdriving the amp. Ergo my comment that I can happily drive the amp all day long at 100W exciter output without any splatter or damaging the tubes (which are the stock 811As that came with the Ameritron; I beleve they are of Chinese manufacture), and with no ALC connection. Since it seems most Ten-Tec rigs (and certainly the Orion) do not have an ALC connection for attachment to an RF PA, this mod might be worthwhile for peace of mind in protecting the PA's finals as well as being a "good neighbor" and not causing splatter by flat-topping your peaks. I have not checked the output of my PA with an analyzer (although I have been toying with the idea of getting one of the units from Clean RF Technologies as I have a 20 Mhz 'scope on the bench), but I suspect this would also be very helpful if you wanted to run a high duty cycle digital mode with a PA and wanted to avoid splattering and taking out a lot of adjacent signals (although I would generally recommend against using a PA with most digi-modes for the sake of those folks who may not have a lot of tight crystal filtering, so you don't swamp their receiver front ends -- PSK comes to mind especially, as it traditionally operates in a very narrow range of each HF band).

Hello everyone
I have a question about the connection between the Orion I and Acom 1000 PA.
More specifically if you have only used the connector Key In on the Acom and AMP KEY 1 on the Orion or if it is better to use the pair of connectors
TX OUT 1 / TX EN 1 on the Orion and Key In and Key Out on the Acom.
From what I read on the manuals of these devices would appear that the second solution is better for QSK.
Thanks
Franco I6QFZ

Like others, I've seen the "red sweep" moving from right to left,
sometimes these sweeps occur within seconds of one another.

I'm also seeing the sweep's white peeks capped by red highlights. Upon
closer examination, It actually appears that there are red peaks behind
the white peaks and that the red peaks are trending higher than the
white ones.

Tried reloading the firmware - no change.

Hi
The flame red sweep is something different from the one you see ''mooving from left to right''.
This one happens from time to time and the whole area of the sweep becomes red.Then you see vertical black lines falling? from top to bottom, again and again.

The red peaks you see are part of the new spectrum.
These are the higher positions of the white peaks but they are delayed so you can see exactly where the signals are.

Fotis,

I checked out the audio lock up you mentioned earlier and
mine did the same thing after a few minutes. Also, thanks
for the tip about pushing the "Scan" button to get rid of the
solid red back ground rather then turning the radio off and back on.
The red is appearing more frequently now and seems to be worse
when I am on 20 meters. Although I can't think of why it should be
worse on any one band.

FYI, I can get just over 800 watts out of the AL-811 with 3 572B's in it if I drive it hard enough. The secret is to keep the grid current under 150ma so that the tube specs aren't exceeded. The power supply in the AL-811 and the AL-811H are the same. They all use the same components in the supplies.

From: Charles Stampf
Topic: 4866 Message: 4866

Is it possible that some of the 'bugs' being seen with the latest beta release are related to corrupt loads to the radio?

I experienced the abnormal audio squeal when switching to AF AGC and selecting the Notch filter. I then reloaded the code a couple times with the same result. I then tried reloading, using another laptop computer with an RS232 port. I did a battery reset to the radio and, lo and behold, the squeal is gone. The radio seems to operate as it should. I can switch from RF to AF AGC with no apparent problems.

I know that there are timing variances among RS232 ports resulting in corrupt data being passed. I wonder if the O2 uses hardware handshaking when passing data to the radio? Or, maybe it was the battery reset that fixed the problem......or was I just LUCKY?

Didn't know that the power supplies were the same between the 811 and the 811H... Hm, almost makes me want to re-tap the xfmr for somewhat higher plate voltage when I put in 672Bs.

With the stock 811As, I've seen 700W PEP on my Dishtronix DWM-2104A calibrated for each band PEP/average reading wattmeter/crossed-needle SWR meter. And that's about as far as I ever want to take my 811As. :D Heck, if the core of the xfmr is heavy enough I could conceive of re-winding it myself at some point to really get more out of a trio of 572Bs. ;)

We now return you to your regularly-scheduled Orion chat (and I have a few more posts to reply to regarding rig control software, as well).

Hi Joe,

Hot plugging is simply the practice of plugging or un-plugging the cable while the connected devices are powered up.
In this case the DB-25/DB-9 connectors have not been designed to have guarantied GND connection established before any other pins have a chance of connecting with their counterpart. Couple that with the common practice of running computers and other electronic gear without a safety-ground connection (against all recommendations or even requirements for installation), is begging for trouble. All computer power-supplies have filters in their mains input, employing a capacitive potential divider between the phase and return, with the midpoint tied to ground. If the ground is allowed to float, or just have a rather high resistance to ground, there may be as much as a 115V (with 230V mains) AC ground potential on the device. Connecting such a device to other electronic devices, with other ground potential, is clearly a recipe for failures.

Hi.
I recently bought a orion II, although I am learning to manage.
The output power is low, only 50 w, measured with my Bird.
I think the ALC will not let go 100 w, any solution?
Thank you.
Francisco EA7GRD

Francisco:

Are you referring to the key down CW output of your O2, the maximum PEP output of your O2 on SSB, or the average power output in SSB?

Is your Bird wattmeter a model 43 or 43P?

Thank you for more information.

73,

Mike

Hi Mike.
80 W in cw mode and less than 50W in ssb mode.
Bird wattmeter model is 43P, I've also used a wattmeter Diamond SX1000 and measures are similar.
Thanks for your interest.

Francisco,

Two, dumb, questions. Are you terminated in a dummy load when you do the measurement and does your power indicator at the top left corner on the screen show 100. If not, make sure it is activated by being in a Blue color and turn the multi knob until it shows 100 then try again. Just a possibility.

4875. Re: [orion565] Re: low power

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-04 23:04:04 UTC
From: Fotis SV8ING
Topic: 4870 Message: 4875

Hello Francisco

I use the Powermaster which is a very accurate wattmeter.When I key down in CW mode I see about 83-84 Watts.When I speak in SSB mode I see peaks at 80,85,sometimes over 90 till 95 (rarely)depending from? the mic I use.
Notice here that you have to ''press'' a little hard the ALC with the 2 mic gains, to get the power out.

If you have the Bird 43p,and you can measure peaks,you should see some peaks way over 50Watts,if you key down 80W in CW.
If your Orion has a tuner and you use it,you loose some power as well .

So something is wrong there in your shack.Check the wattmeter, set up again your Orion and good luck!

I would like the Orion to have a little more power,too.About 10-15Watts more...
But you can't have it all...!

4876. An odd problem Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-05 00:45:10 UTC
From: Ross
Topic: 4876 Message: 4876

I mainly use my Orion II to drive a transverter for EME. I decode the information coming down with WSJT 6.

That program shows the input signal strength coming from the receiver and for efficient decoding needs to be set
at about 1db.

My problem is that the ouput from the Orion decreases quite rapidly after switching on. Initially set up with WSJT showing 1db, over the next 30 to 45 minutes the output decreases to -5db.

It is not the input signal to the Orion, which comes from a large 2m array, as I have swapped the transverter 28mhz output
from the Orion to my Elecraft K3 and WSJT with the K3 is rock staedy on 1db.
Yes the interface between the Orion and the computer is a USInterface Navigator, but that is not the problem as I have
swapped those as well, (I have 2 of them) and the problem still occurs.

The Lineout on the orion II is set at Line out source "Main" Line out level "High"

Comments and advice please.

Regards
Ross
ZL1WN

Hello Francisco:s The IF Converter Board is located directly under the speaker in the O2. I am attaching a photo which clearly shows the ALC Set pot on the converter board. It is to the right of three other pots, including the meter calibration pot. It is clearly labeled. Set your encoder to show 100 watts on the O2 screen, and I would set the ALC Set pot to produce an output of about 110 watts maximum. Your radio should then be able to output 100 watts easily into a 50 ohm dummy load. Ignore the ALC lamp. It is not a good indicator of adequate audio drive level. The lamp should be lit continuously, and your Speech Processor on and set to number 7. Adjust your microphone gain, and your hardware microphone gain, to indicate an average power of about 45% of the Maximum PEP output. Without adequate microphone gain, the RF compressor will not produce a significant increase in the average power output. After you have adjusted your O2, according to the above, get some on the air quality checks. You should receive excellent reports, as the processor does not distort the audio in any way at these levels. I found my photo, it should make adjustments very simple for you. Just make sure your Bird 43P has a good 100H element, and your dummy load is truly 50 ohms. Good luck. 73 and Happy DXing, Mike W2AJI ------

4878. Possible Orion II/2.041XL Bug - VOX hangs

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-05 09:25:38 UTC
From: Peter Frenning [OZ1PIF]
Topic: 4878 Message: 4878

I have noticed that my VOX hangs indefinitely once in a while. Simply turning VOX off and on again clears the condition, and you can continue VOX operation - at least until it hangs again - sometimes in few minutes, at other times you can go on for several hours before it fails.

I haven't seen this reported before - anyone else noticed?

You must report all these things directly to Ten Tec to get them fixed. They may or may not read this reflector.

Question is how, or rather what email address? There's no such address I can find, the nearest is: sales@... and that's hardly appropriate for this purpose.

Hi Mike.
I followed your instructions and the problem has been solved, now the O2 pulls 100w of power without any problem.
Thank you very much for your help, also the other group members that have expressed interest in the problem of my Orion.
Good luck. 73
Francisco EA7GRD

>
> Hello Francisco:s The IF Converter Board is located directly under the speaker in the O2. I am attaching a photo which clearly shows the ALC Set pot on the converter board. It is to the right of three other pots, including the meter calibration pot. It is clearly labeled. Set your encoder to show 100 watts on the O2 screen, and I would set the ALC Set pot to produce an output of about 110 watts maximum. Your radio should then be able to output 100 watts easily into a 50 ohm dummy load. Ignore the ALC lamp. It is not a good indicator of adequate audio drive level. The lamp should be lit continuously, and your Speech Processor on and set to number 7. Adjust your microphone gain, and your hardware microphone gain, to indicate an average power of about 45% of the Maximum PEP output. Without adequate microphone gain, the RF compressor will not produce a significant increase in the average power output. After you have adjusted your O2, according to the above, get some on the air quality checks. You should receive excellent reports, as the processor does not distort the audio in any way at these levels. I found my photo, it should make adjustments very simple for you. Just make sure your Bird 43P has a good 100H element, and your dummy load is truly 50 ohms. Good luck. 73 and Happy DXing, Mike W2AJI ------

Hello Francisco:

I am very glad to learn that the procedure for calibration of your ALC restored the full output of your O2.

I received many emails asking for the picture of the IF converter board, and I will make the picture available on my website, along with the instructions for adjusting the ALC set point, as well as the method for adjusting the O2 microphone gain controls to assure the Speech Processor (RF Compressor) is working optimally.

I hope to see you on 20 meters soon.

73 and Happy DXing,

Mike

From: Dave
Topic: 4888 Message: 4888

Hi, to the group,my name here is dave ,and i get my orion 11 delivered on tuesday and am making up cables for data/fsk use.
I have been reading up on information about the orion but cannot seem to find any info as to whether when using the rear socket the microphone is automatically muted in transmit, can anyone advise please.
regards de
dave gm6jua

No, it's not automatically muted.

Topic: 4888 Message: 4890

Barry,

No it is not muted when a signal is sent to the AUX I/O input (such as in PSK31 when the sound card is routed to the AUX I/O jack).

However, all is not lost, in the SSB sub menu, you can select the audio source to BOTH, MIC, or AUX.

It is not Dave, the FT-847 has a leg up on the Orion in this respect ;-)
Seriously: I have set up "User1" parameters to suit phone work, and
"User2" for Digital modes.
You select the Audio Source in the "SSB Menu"
This way I can easily shift all the settings to the most suiable values.

I agree with Ed on this. We should have asked you this question long ago. Your Orion needs a DEDICATED power supply, directly wired to the radio. NEVER hook up the Orion to a power distribution bar or a power supply of less than 20A with plenty of overhead. I run my OII on a dedicated 35 amp supply.

I strongly recommend this before you send the radio back.

Let us know.

Subject: [orion565] Re: New owner, issues/problems/questions -- update

Adam, the Orion appears to be very sensitive to the supply voltage, and has been known to exhibit some strange behavior if it is not adequate. Before sendint the unit back, I would recommend taking a look at the power connector. Make sure that the contacts are clean, and that the split male ends have not compressed, causing the connector to be loose. Also, pull the fuse, and clean the contact surfaces. There is an article on the Ten Tec Wiki at www.tentecwiki.org/doku.php?id=565pwrconn <http://www.tentecwiki.org/doku.php?id=565pwrconn> that you may want to read, entitled 'Orion 565 Intermittent Power Connector Fix.'

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-06 22:16:43 UTC
From: Larry Menzel
Topic: 4860 Message: 4894

Hello, Franco, good evening.

Yes, use the second setup with two cables. Be sure to go use the outputs on the back for keying loop 1. Then go into the TX menu and turn Keying Loop 1 to ON. I set the keying loop delay for about 8%. Then go into the CW menu and play with the CW rise time setting. Set the radio to cw and listen while you transit. As you vary the rise time, you'll get better or worse response from the keying circuit regarding what you hear. Set it so that you don't hear any breaks in the receive audio as you're sending. A 3 or 4 usec seems to work well. You may have to change this setting depending on whether you're keying the radio directly with a paddle, or via a contesting software or WinKeyer.

This is a wonderful qsk PA and I know you'll enjoy it as much as I do.

Subject: [orion565] Orion I and Acom 1000

Hello everyone
I have a question about the connection between the Orion I and Acom 1000 PA.
More specifically if you have only used the connector Key In on the Acom and AMP KEY 1 on the Orion or if it is better to use the pair of connectors
TX OUT 1 / TX EN 1 on the Orion and Key In and Key Out on the Acom.
From what I read on the manuals of these devices would appear that the second solution is better for QSK.
Thanks
Franco I6QFZ

Dave,

It may not be the least expensive solution, but for my money and ease of use, purchase a microHAM microKEYER II for your digital needs. It's SO SLICK. Works first time, every time, built in sound card, all digital modes, works with all contesting software.absolutely great! The wiring kit that comes with the mKII is set up exactly for your Orion II and it's literally plug and play as soon as you get it hooked up. Start up their "Router" software, establish the virtual com ports, and it's as easy as that.

BTW, microHAM has THE BEST support of any ham radio accessory I have every used.

Usual disclaimer.no financial interest, only a satisfied customer.

Dave, I strongly suggest that for RTTY you wire your OII for FSK rather than AFSK. The filtering is vastly better, and you can use the FSK mode.

In that case, muting the microphone will not be an issue.

I'm not trying to stir up anything here, but I will say that since buying my Orion II three years ago, I have run it from a five position West Mountain Radio Rig Runner buss system. The Rig Runner is powered by an MFJ-4245 Switching type supply and the same power supply also powers my K2 and some other stuff. I never turn the O2 on and off with it's own switch. The entire station is turned on and off by a master switch mounted in a standard electrical box. It is just a switch like you would find on a wall to turn on a light. The station is turned on at 6AM and off at 11pm everyday (almost). I have never had a problem. I don't have freeze ups, crashes squeals, or red screens. I love the operating system, 2.0..whatever, loaded a year or more ago.

Having said all of this, I will probably have jinxed my entire station and it will disappear in a cloud of smoke and flame the next time I turn it on... :-)) So far, I guess I have been lucky.

Right, but plugging a $400+ microKeyer into the rear socket instead of
Dave's homebrew cables isn't going to mute the mic automatically
either. Nothing wrong with homebrew cables . . . or slick commercial
devices either . . .

I have had my Orion II on an Astron 70 amp power supply since new which also powers my Yaesu FT-847 that I use for VHF/ UHF weak signal work with no issues.. I do however have a couple of toroids clipped around the power leads, and have them as short as possible like TEN TEC suggests...

I think this post was originally about an Orion I tho, and from what I know those are more prone to interfence from RF and the like through the power and audio inputs (4 mire mic plug on front panel)..

Hello, Franco, good evening.

Yes, use the second setup with two cables. Be sure to go use the outputs on the back for keying loop 1. Then go into the TX menu and turn Keying Loop 1 to ON. I set the keying loop delay for about 8%. Then go into the CW menu and play with the CW rise time setting. Set the radio to cw and listen while you transit. As you vary the rise time, you'll get better or worse response from the keying circuit regarding what you hear. Set it so that you don't hear any breaks in the receive audio as you're sending. A 3 or 4 usec seems to work well. You may have to change this setting depending on whether you're keying the radio directly with a paddle, or via a contesting software or WinKeyer.

Please DON'T set your risetime to 3-4usec. If you search through the
TenTec reflector archives, you'll find long discussion on this issue
and a lot of on-air testing done seeking to minimize keyclicks. The
actual risetime is about half of the indicated value. You should set
it to 7-8 usec to avoid generating keyclicks.

That's news to me. I run my Orion I and all the other 12V shack gear, including an IC-706 for VHF/UHF, PowerMaster meter, keyers, DigiKeyer, modem, and Alinco packet 2m radio all off of a homebrew ferromagnetic 50A power supply and have never had a single problem with it. I route the power through a WestMountain power breakout box with Anderson PowerPole connectors, not that this is critical.

4905. Line out level Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-07 04:16:59 UTC
From: Ross
Topic: 4905 Message: 4905

The line out level can be adjusted in the "other" menu, but can it also be increased further as I need a bit more ouput
from the the High output.

On the K3 the line out can be increased and decreased, apart from the fixed settings on the Orion II is there another way of increasing
the Line Out output??

Regards
Ross

I think you are probably looking for an answer that consists of adjusting something inside the O2 that is variable, but the obvious answer (given my background as a trained audio engineer) would be "add a line level amplifier". You can build a very simple low-gain unit for a pittance, or buy a commercially-made one for a little more.

Is there any chance there might be an impedance mismatch between the rig's line out hardware and whatever you're plugging it into? Something like an isolation transformer, but with a non 1:1 ratio, might be great answer here, as it would isolate the rig from whatever you're plugging it into, AND it should also raise the level of signal getting to your connected device (computer sound card?)

I didn't expect that it would, even aside from the fact that we're talking about two very different things now. ;)

> I wouldn't expect a v. 3 firmware, for example.
> (But I'd like to be proved wrong.)

Me too. The 565 still has some kinks in the programming, but I am betting that with the cost of hiring on extra programmers and updating computers, it's not likely they would spend that much money on something that, at the end of the day, they give away. This is one of the reasons I am hoping they will release the source code, although if their current rigs are more evolutionary than revolutionary, that alone might be enough to prevent this from happening, as they'd essentially be giving all of their competitors their biggest and best secrets (many of which are probably still in use in their more modern rigs) for their current models. I predict that they won't ever give anyone source code while any part of it is in current models, or could hint strongly toward their current programming tricks and practices.

> Personally, I would be glad to pay a small annual
> fee to keep the software developer well motivated to

> thing as bit rot.

Well, at $30 a year, it only takes 2 years' worth of payments to nearly equal the replacement cost of the software itself. And heck, if he doesn't make you pay consistently (without which you end up losing your whole policy), then it makes more sense to say no and then just buy it as an add-on in years where there has been some significant update that you want.

As to bit rot... Well, I have plenty of legacy software here and run it over the freeware program from Microsoft called "Virtual PC". Easy to learn, you can make your machine emulate an earlier machine with an earlier OS. The program uses all your I/O devices and maps them all, so if the Virtual OS beeps at you, even if the window is not in focus, it comes out your PC's speaker(s).

> You are right that the serial port control of
> the 565 is not fast enough to fully emulate

And I guess the idea of rig control was still pretty new when the Orion came out, yeah? A shame, this radio could be truly great to operate remotely, or together with digi-mode software like HRD and DM780.

> In fact, there are several front panel controls
> that cannot be overridden from the serial port
> at all (band stacking regs, auto antenna
> selection, some audio settings, etc.), and
> that's a nuisance.

A real shame, actually. How much extra could it have cost to increase the polling rate and helps with packet collision avoidance?

> The N4PY software does a surprisingly good job,
> however.

I like what I have seen so far. I especially like the host of additional behaviors from the software that cannot be easily replicated on the radio itself.

Tnx es 73!

I have a commercial power supply conservatively rated at 35 amps continuous, but rated for 50 amps peak. I've watched the supply voltage with a multimeter, and it does not vary at all, not even a flicker, on key down with the Orion in CW mode with full power out.

I'd also be incredibly surprised if the radio was entirely flawless in its performance and showed *none* of the other signs of lack of sufficient supply power, but had the sole problem in the sub receiver being caused by an insufficient power supply. Occam's Razor says "does not compute". :D

> I strongly recommend this before you send the radio back.

Did my post from last week not make it to the list? I already fixed the problem. It was a bad ground side connection on one of the IF coax connectors on the sub receiver board. I found the one that wiggled too much, made the connection more solid, and the problem went away and thus far has not returned.

No RF in my audio anywhere, even when running my 600W PA at full clip. Station is well grounded, coax is heavily choked at the antenna feed point, and the antenna was placed specifically to make more of the RF end up in foreign countries rather than my or my neighbors' living room. :)

4911. Orion 565 (model 1) contrast issue & fix

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-08 09:48:08 UTC
From: pa1ap
Topic: 4911 Message: 4911

Greetings,

I have raised the question on a contrast problem I had with my orion.

The problem:
The difference on lcd contrast between cold start and warm status of orion was to large to be acceptable. I also saw that changing contrast to either minimum or maximum through the menu showed either upper left corner or bottom right corner to be "dirty". Pictures of this are uploaded to the photo section. The challenge was that after about 30-45 minutes i had to adjust the contrast to keep a sharp and clean lcd contrast, which becomes annoying after a while.

The solution (in my case);
Through great help of Mike (W8TRN) I learned that the dc-dc converter board (A9) might have some weak capacitors (aging or something like that) and after a trip to the local electronic shop I replace them. Just to make sure I replaced the following capacitors (c1 & c2, c9, c6, c7).

The result:
There is minimal difference now between cold and warm status of the orion. also when turning contrast to either minimum or maximum the lcd screen isnt showing the upper left or bottom right corner issue anymore. Minimum is now a solid dark and maximum is now a solid white. I believe this is how it should be.

The weird thing;
I was curious what was wrong and prior to the capacitor replacement I connected the scope and multimeter to the dc-dc board to see if I could actually measure the problem.... well... there is little change but not shocking much... The voltages went up a little from cold start to warm condition (1 hour later) but we are talking about 50mV (dc) or so. The scope on the other hand showed that at cold start there was a superimposed AC component (many spikes) at a level of around 50-90 mV... Again, not to shocking...
Then after replacing the capacitors I repeated the measurements again and surely the multimeter didn't show any difference but when connected the scope I could clearly see the superimposed spikes where greatly reduced. The are not gone but certainly a lot less. The weird thing is that we are talking about up to 100mV spikes (at least thats what my scope has shown) and I can see a significant improvement with regards to contrast and stability. (I have uploaded pictures into photo section)

perhaps the -21 Volts goes into another dc-dc converter to energize the backlight. and perhaps this converted is sensitive to those spikes. I really dont know. anybody suggestions?

Hope this helps and all credits for the solution to Mike of course!

best regards,
Onno, pa1ap

Did you replace them with components with the same rating as the stock ones? I'd be quite interested to know the spec of the capacitors you ended up using, and if you have any photos you took of the process, befpre/after, calling out the specific caps you replaced in a photo, etc., I'm sure I'm not the only one who would love to see them. ;)

Thanks very much for sharing this with us. I have been living with the screen's behavior and working around it for the most part, but it sure would be nice to end up with the results that you got. :D And any excuse to open up expensive electronics and poke around inside... ;)

Greetings,

I replaced them with the same type of capacitors with same rating. I did not make pictures of the replacement process but in summary;

0) disconnect the rig from power, make sure there is no way for the unit to start.....
1) open the rig, bottom and top cover
2) turn rig upside down, bottom to the top
3) dc-dc converter board is at right corner, near the s-meter.. it is the smallest pcb board available.
4) disconnect the backlight cable (small white cable connector)
5) remove the pcb board by removing the four screws (philips type)
6) carefully slide the pcb board (horizontal) to disconnect from the "backplane" connector to the left
7) take your soldering iron and start replacing the capacitors
8) put all back and see if that fixed the challenge as found.

No warranty provided by the way.... It worked for me but that doesn't mean it will work for you. also take into account the polarity of the capacitors, especially c1 and c2 since they connect different then one would expect.

It would be great if someone could capture the voltages and hash/spikes using a scope as well to compare notes. I have uploaded the pictures to the photo section.

Also I got great help from Mike who figured this out and was very kind to share his experience with me.

Hope this helps, Best regards, Onno pa1ap

4914. new firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-09 18:48:05 UTC
From: Andrew B. Steen
Topic: 1581 Message: 4914

Greetings to all. My name is Andrew, and the call is K6STN. I have been running the Orion II for about 9 months now, and just upgraded the firmware to 2.041XL. It seems to have improved a couple of things such as the AGC function. NR seems to also work well now also, without the distortion previously noticed. I'm curious as to who else has downloaded the new firmware, and how they like it. One thing I noticed is the spectrum display will on occasion turn red and appear to have the waterfall superimpose over it. I have to turn off the radio to clear that. Any comments?

73, Andrew, K6STN

Greetings,

I'm grateful to finally have the Orion II. This is a fine radio. Straight forward and very easy to use. The interaction of RF gain and NR is striking, among other things. NR works well for me.
This Orion II is s/n 05C10986, went into service 07/14/06 w/ v2.039D fw. I'm very happy with the performance. Are there any users out there that had this version firmware in there Orion II, and recently updated to the new fw release? If so, besides the shortcomings many have identified with the recent fw release, is it worth updating?

Thanks.

Terry

If you will do some looking through the archives of this reflector for the past three weeks or so, you find extensive discussion of the new firmware.

Does that bother you so much that I ask?

>.............is it worth updating?>

That was my question.

The answer YES, or NO will suffice. That kind of answer can't be too difficult.

Without further bemoaning, or belaboring, in acceptance or exchange thereto, many thanks in advance to anyone willing to provide that simple answer.

Whoa Terry, you are asking a question that requires a bit
more than a simple YES or NO ... it's very subjective as
to if the new version offers enough to overcome the few
bugs that have been reported.

I like the new ability to set the power/etc by band. So that
would be a YES.

I DO NOT like the problem now that the VOX will hang on XMIT
and you have to reset it by cycling the switch. So that would
be a NO.

Ditto on the RTTY AGC problem which I can replicate, so NO.

The "red screen of sweep death" is not a big problem to me, I
only noted it once during the ARRL DX contest this weekend, so
that one is neither a YES or NO so far.

Dave, K4TO is a pretty sharp guy ... not a smart*** by any means,
nor am I trying to be one, but your question is very subjective!

For now, I am staying with the latest firmware and fully realize
that this is a BETA version and will wait a bit before I go back
to the previous revision if the BETA is not replaced shortly.

My suggestion to everyone who is using the BETA version, is to be
sure and share your results with Ten-Tec at ditsnbits@...

Terry, load the new firmware, and tell us what YOU like/dislike.

THX Billy.

So in other words.............

"The CONS may outweigh the PROS, but it depends on how you use the Orion II. The only way to know for sure is to try it for yourself."

That's all you had to say.

Some folks feel uncomfortable when forced to commit to an answer. That's okay.

But yes, loading the new FW and trying out for myself is the only way to find out for sure.

It's still a great radio. I'm sure Ten Tec will get things worked out. I like this Orion II much better than the K3 I traded for it.

Thanks for the help Billy.

Hi Terry
this is a beta version meaning that you will face bugs ,problems and possible crashes.
If you haven't got a problem with that,then yes try it.
If you want a? version without problems and more stable,then stay to 2.039.

My choice is to stay with 2.041.I always like to experiment with new FW updates.
I like much the new sweep and the 2 AGC's.

Does that bother you so much that I ask?

>.......... ..is it worth updating?>

That was my question.

The answer YES, or NO will suffice. That kind of answer can't be too difficult.

Without further bemoaning, or belaboring, in acceptance or exchange thereto, many thanks in advance to anyone willing to provide that simple answer.

Hello Terry.

I got the same "canned" response you did reference your questions on the new beta release. Not much help there, just a pass off to the previous few remarks on the new fw. While I don't consider the replies "smart ***" I thought they were a little condescending. I thought the forum was all about a helping hand, not a redirect. Maybe we know as much as they do now. If I figure out anything new on this, I will be more than happy to share my findings with you.

Subject: [orion565] New Orion II owner.

Greetings,

I'm grateful to finally have the Orion II. This is a fine radio. Straight forward and very easy to use. The interaction of RF gain and NR is striking, among other things. NR works well for me.
This Orion II is s/n 05C10986, went into service 07/14/06 w/ v2.039D fw. I'm very happy with the performance. Are there any users out there that had this version firmware in there Orion II, and recently updated to the new fw release? If so, besides the shortcomings many have identified with the recent fw release, is it worth updating?

Thanks.

Terry

No worries Andy.

There is plenty of information here, and I'm sure lots of fine people here as well. All the responses helped in some aspect.

It's all good.

Hopefully Ten Tec will become active again with the firmware improvements for 565/566 models.

I'm looking forward to good times with my 566.

The only other radio I was as happy with when I bought it was the IC7700.

And with that, I better conclude my replies here, and let better things here move up, and move on.

Thanks to those that replied. Every little bit helps.

Received this comment from the contest ....
"You sounded great on 160, nice clean audio."

Data points: Orion II Internal SP = 7
MIC = 6 - 10
H/W MIC = 2.0 dB
TX Filter BW = 2550 Hz
L.F. Rolloff = 200 Hz
715 set to PASS BAND = 12 o'clock
PROC GAIN = 8 o'clock
PROC LEVEL = 2 o'clock

The 715 also works well with a FT1000MP as noted on eHam.

I hope this helps,

73 de Billy, AA4NU

4927. Re: Orion 565 (model 1) contrast issue & fix

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-10 12:44:18 UTC
From: pa1ap
Topic: 4911 Message: 4927

Greetings,

an update on the LCD contrast issue;

after a few days of using I found that my original issue of diagonal contrast issue has disappeared completely. In my case the capacitor replacement did its job.

I do see that there is still a difference between cold and warm status of the rig. It isn't that large anymore and if set correctly a good compromise can be set and left alone. To maintain perfect contrast I have to change about 3-5%.

Perhaps there are two issues. One issue could be the leaky capacitors and another could be stability of the LCD screen / contrast.

If you find diagonal contrast issue you might want to replace those capacitors. If its only lcd contrast stability its not proven the replacement makes a difference.

Anyway, wish you all the best and have a nice day!

Best regards, Onno pa1ap

Hi Dave,

Consider buying an ATU from "LDG". They make a "made for ORIONII drop-in" ATU that works very well. It uses all the features like an original from TenTec with the menu control etc and if I remember correctly you save about $150 to $200. You install it your self and the nice thing is that TenTec still honours your warranty. It works very fine for me. The model # is OT11P and cost me $149 US two years ago. 73 and have lots of fun with you new rig.

Duane,

I just went to the LDG site and you are right. I can't find it at all. Hmmm I wonder why. Could it be because I heard that they are producing the ATU for the ORION-II and where told not to make it anymore? Curious isn't it. My apologies to Dave for letting him astray.

Congratulations Dave. I also got one this past Saturday. Just upgraded the firmware to the "controversial" newest release 2.041XL. So far so good. It will take a bit to fully "wring it out", but I'm sure most will be fine.

I posted a quick view on You Tube.

http://www.youtube.com/watch?v=whL_1RhLSOw

I hope you enjoy your Orion II as much as I enjoy mine.

As I recall the scenario, they built the original Orion I ATU - mine has the LDG in it. Then TT began putting their own in. At some point in there, LDG started offering one as an aftermarket add-in (TT did not offer it except at time of order.) I believe the add-in LDG had memory tune while the original didn't. My guess is that they didn't sell enough of them. For what it's worth, the TT version has memory (the LDG in the OI didn't) and tunes faster. Range on both seems about the same. I used a friend's Orion II with the tuner for a while and like the TT tuner a lot. OK, that's more than I know about it!

Hi Dave,

Consider buying an ATU from "LDG". They make a "made for ORIONII drop-in"

ATU that works very well. It uses all the features like an original from

TenTec with the menu control etc and if I remember correctly you save about

$150 to $200. You install it your self and the nice thing is that TenTec

still honours your warranty. It works very fine for me. The model # is

OT11P and cost me $149 US two years ago. 73 and have lots of fun with you

new rig.

Topic: 4925 Message: 4938

I called T*T when they released the speech processor to see what it will do as I already use the W2IHY 8 band Equalizer/Noise Gate and the W2IHY EQplus. Basically, the T*T model will cut out all the lows and spruce up the mid-range, compressing more audio into that group of frequencies. That's great for DX, however the W2IHY will do everything the T*T unit will do and more, tayoring your voice to the radio and then adding compression, slight delays, bass and treble boost where needed plus a downward expander. Instead of removing the bass the W2IHY gear enhances the lows for that rich deep broadcast sound that you lose in most SSB transmissions.

Yes the two units cost more than the T*T's single unit, but if you want an FM like broadcasting voice, something that is enjoyable to listen to on the other end, then the W2IHY audio gear is the way to go.

Julius has put long hours into the development of his equipment, and he is there almost 24/7 to offer support and set up help.

And using a mic preamp, rack-mount line level compressor/limiter/noise gate and parametric eq, and a box called a "re-amper" will do all that both the Ten-Tec unit and a $700 set of W2IHY gear will do plus a lot more for a touch less than half the price of the W2IHY gear. Since even eSSB is not very high fidelity, you can use fairly cheap rack mount effects without degrading your sound quality as far as someone at the other end of the QSO is aware, and you get a whole lot more flexibility in tailoring your sound -- especially important as each voice and each mic are different, and what works best for one will likely not work best for the majority of others.

> Yes the two units cost more than the T*T's single unit, but if
> you want an FM like broadcasting voice, something that is

Fine for short-hop round tables, but adding all that bass in just steals power away from your PA finals that could be used to deliver more signal strength in the all-important upper midrange, which is the core of the intelligibility of speech. So if you work DX a lot, you'd really be shooting yourself in the foot using the W2IHY gear if it cannot be made to leave bass alone, or even roll some of it off. Of course, we can do that easily enough in our Orions, too, so for us, perhaps, that point is a bit moot.

> Julius has put long hours into the development of his equipment,
> and he is there almost 24/7 to offer support and set up help.

And one could homebrew equivalent function hardware for less than a third the price. Of course, one would have to know how to get to "good" settings, then spend time making up circuitry to ONLY allow those combinations you consider "good". Of course, as I mentioned, that varies from voice to voice and mic to mic.

My audio front end is an Audio Technica AT-2020 condenser mic, Behringer Tube Ultragain MIC200 preamp/phantom power box, Behringer T1951 Ultra-Q parametric EQ, Behringer T1952 Tube Composer comp/limiter/noise gate, Pro RMP Studio Re-Amper (does impedance transformation and isolation -- essentially an audio balun), then into the mic connector. Total invested, including boom arm, was $560 (not counting cables, but all the cables are

either generic or easily made from simple parts like a 4-pin female mic connector to solder in to a shielded cable with 1/4" plug on the other end). Compare against the cost of the 8-band EQ box, the noise gate/EQ box, and the isolation box from W2IHY.

All that said, using RF has some significant advantages over other forms of audio compression. Ten-Tec appears to be using an "in-between" sort, that is better than audio processing gear can be, but isn't as good at raising RMS power out while maintaining a lovely voice tone that can still pack some punch as, say, the audio processing in my old Kenwood TS-520S. But I would be quite interested to do some A/B comparison, as the TX as well as the RX end. If anyone has one of these Ten-Tec boxes, and has a little time, please email me as I'd like to set up a sked for some testing. :)

Incidentally, my experience comes from a number of years as a professional audio engineer; there is plenty I don't know, but also plenty I do. :D I'd stake my gear against W2IHY for sound quality and easily beat them in adjustability (I can flip one switch, use the user profiles to make it a single button-press to switch the bandwidth and bass rolloff for TX on the Orion, and have gone between a nice, clean, open and full eSSB sound to a crunchy, narrow DXing tone that cuts through static, pile-ups, QSB, you name it. I spent this past weekend tweaking my settings during the SSB DX International contest, and I was breaking pile-ups on a fairly regular basis. Why is that news? I was using 600W PEP and a Hustler 5BTV trapped multi-band vertical. Yep, an HF vertical and 600W, and I was busting pile-ups halfway around the world, sometimes in a matter of under 20 seconds. Sure, I had to work for some of them, but IMHO I should have had to work for all
of them, competing as I was against people running 2 kw and stacked 5EL beams, or worse. :)

I'm just scratching my head here. You guys can't be using the same rig I'm using - Orion I with v1 firmware. This rig has THE best speech compressor I've ever encountered. It's almost magical how constant the ssb output power is maintained (my amp has LED peak output meter) while providing very pleasant compressed audio quality. And -20dB TX EQ rolls off the lows just the right amount for dx/contesting.

73,
Barry N1EU

Nothing to do with the radio Dave, other than plugging in the serial cable. The port settings are done on the computer, and it will decide the port. Some software will automatically determine the port for you, but in many cases, you can pick it yourself. Some ports are reserved for things like the mouse or printer. I use a lot of the usb to serial cables, and I just go through them until the cat in the radio picks it up. The parity, and other settings are the same as other radios or devices, I don't recall having to change them from default. The speed on the other hand, I start at 4800, and see how far I can go, usually around 9600. Your radio software should give you some insight as to what works. For example, my logging program uses comm. Port 6, baud rate 56, parity none, data bits 8, stop bits 1, connection pwr RTS, and polling rate of 500 ms. Hope that helps alittle.

Regards, Andrew K6STN

It is to the right of three other pots, including the meter calibration pot. It is clearly labeled. Set your encoder to show 100 watts on the O2 screen, and I would set the ALC Set pot to produce an output of about 110 watts maximum. Your radio should then be able to output 100 watts easily into a 50 ohm dummy load. Ignore the ALC lamp. It is not a good indicator of adequate audio drive level. The lamp should be lit continuously, and your Speech Processor on and set to number 7. Adjust your microphone gain, and your hardware microphone gain, to indicate an average power of about 45% of the Maximum PEP output. Without adequate microphone gain, the RF compressor will not produce a significant increase in the average power output. After you have adjusted your O2, according to the above, get some on the air quality checks. You should receive excellent reports, as the processor does not distort the audio in any way at these levels. I found my photo, it should make adjustments very simple for you. Just make sure your Bird 43P has a good 100H element, and your dummy load is truly 50 ohms. Good luck. 73 and Happy DXing, Mike W2AJI ------

Topic: 4941 Message: 4947

Dave,

I have my O2 connected to Com port 1 on the computer. The radio uses 57600, none, 8, and 1 according to the manual. Also I have seen responses to use "Handshake"; though I am not sure where you set that. My computer has "Hardware", None, and Xon/Xoff for the options.

Personnally, I have used the default setting for the port (9600, none, 8, 1 and no flow control. I use DXBase logging program for rig control and I have upgraded all the new releases with the aforementioned settings and have not had one lick of a problem.

I am not sure, but I think XP automatically sets the baud rate for the com port based on the program. I.E. In DXBase radio set up the baudrate is set to 57600 with none, 8, and 1. I do find the radio seems to respond better when I have "CTS" checked (the other options are DTR High and RTS High - which I have un-checked)

Maybe someone a little more "computer savey" can fill both of us in with a little more "knowledge" on the above.

Dick K8ZTT

can someone please supply me with the com port settings to hook up the orion11 to my computer please,i would be much obliged as they don't seem to be written in the manual,or I'm just not finding them.
regards
Dave

Thanks, Mike, very clearly stated and good photo. I'll do my OII this weekend.

Great website, too, btw.

Hello Orion II Fans:

I have posted the ALC adjustment procedure and IF Converter Board photo on my website as requested by several members.

The procedure for optimizing the operation of the Speech Processor is also included on the website.

You can visit the webpage here which contains the procedures and photo:

http://home.earthlink.net/~cherokeehillfarm/id2.html

73 and Happy DXing,

Mike

> > >
> > > Hello Francisco:s The IF Converter Board is located directly under the speaker in the O2. I am attaching a photo which clearly shows the ALC Set pot on the converter board. It is to the right of three other pots, including the meter calibration pot. It is clearly labeled. Set your encoder to show 100 watts on the O2 screen, and I would set the ALC Set pot to produce an output of about 110 watts maximum. Your radio should then be able to output 100 watts easily into a 50 ohm dummy load. Ignore the ALC lamp. It is not a good indicator of adequate audio drive level. The lamp should be lit continuously, and your Speech Processor on and set to number 7. Adjust your microphone gain, and your hardware

microphone gain, to indicate an average power of about 45% of the Maximum PEP output. Without adequate microphone gain, the RF compressor will not produce a significant increase in the average power output. After you have adjusted your O2, according to the above, get some on the air quality checks. You should receive excellent reports, as the processor does not distort the audio in any way at these levels. I found my photo, it should make adjustments very simple for you. Just make sure your Bird 43P has a good 100H element, and your dummy load is truly 50 ohms. Good luck. 73 and Happy DXing, Mike W2AJI ------

Martin,

Thanks for the information; but how do you turn "handshake" on or off? That is not one of the options in either the Windows control panel nor in DXBase. Windows has three for flow control (OFF, HARDWARE, and Xon/Xoff). The setup in DXBase allows you to check DTR high, RTS high, and CTS.

The best I have found out so far is to check RTS High and CTS.

Dick K8ZTT

Orion uses "handshake" and to set that on. All fine and dandy, except "handshake" on/off is not one of the options in DXBase; and in the windows control panel it is not either (options are OFF, HARDWARE, or Xon/Xoff)

4951. Rig Remote Control

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-14 00:45:51 UTC
From: Brad
Topic: 4951 Message: 4951

About a month ago I asked a few questions about rig remote control via the internet.

Some folks were interested in how it could be done so I put together a tutorial about my scheme an posted it to www.w1nt.com

There is a link to the presentation in the green updates section on lower right of the main page.

Hopefully someone finds it useful.

Brad, W1NT

4959. Re: Orion 565 (model 1) contrast issue & fix

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-15 12:36:28 UTC
From: pa1ap
Topic: 4911 Message: 4959

Greetings,

Learned through the manual that the backlight is provided by white LED's and that the -21 Volts is connected to a potmeter prior to connecting to the LCD contrast pin on the LCD module.

with the recent upgrade to release 2 I learned one has to adjust the contrast potmeter significantly in order to achieve good contrast coverage through the menu setting. The question is what changed between release 1 and release 2 and right now it seems the refresh rate changed, causing a different contrast setting combined with sharper resolution. This also means the lcd screen becomes more sensitive to spikes and hashed on the contrast input.

It might be worth to provide a "clean" -21 volts signal to the contrast input of the lcd screen. This would require a new dc-dc device to generate this voltage.

Is there somebody in the group with experience on LCD displays who can advice on this?

Thanks and best regards,
Onno pa1ap

4960. FS: **TWO vinyl dust covers $35.00 each shipped**

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-15 16:59:45 UTC
From: Stan
Topic: 4960 Message: 4960

Hi Gang.
I have added VINYL as a option for my covers. I made up two covers to show at a local swap meet.
Both are black and one has white lettering (with orange "O" between the two "T"'s and is for the Orion II. The other is a CLEAR fronted cover and will work with the Orion or II model (no lettering or logo on the clear fronted covers).
Price is $35.00 each. Please visit my website below for more info on my covers and lots of pictures of many of the different covers we make,logo's,colors,etc.

PLEASE CONTACT ME VIA my website: www.radiodustcovers.com OR direct at: stan @ radiodustcovers . com I will not respond to any post here on the group.

Take care, Stan W6ON

I would check to see what filters are installed, is there an auto tuner installed, what other installed options are included with the price. On a scale of 1-10 where does it fall ? To me, that price boarders on fair, for another $1k you could have a new one. At $2200 to $2500 that would be a better price (afterall, it's used).

Just my thoughts.
Sam
K3SAM

(I see it's an /AT, auto tuner included...)

I'm in the process of buying an Orion II and I was looking at the rear panel in the operating manual and Ok, I'm not the brightest light bulb, but can someone tell me where the ALC connection is on the Orion II. Please tell me it has one. My SPE amp is not going to be very happy if it doesn't. I know I can control the drive with the RF power control, but I sure like for my amp to handle this job.

Thanks,
Bob

Bob,

There is not one.
There is no need for one.
Keep the amp tuned and loaded properly
and you will never need one either.

Truth is, ALC does not work very well at containing transients that can cause serious damage; this is probably why it is not included. And in point of fact, when you commented that you'd rather have the amp handle things, you seem to have misunderstood how ALC works. It's the rig that turns its drive down when it receives indication via the ALC line that the amp is being overdriven; the amp just sends the signal to the xmtr, it's the xmtr that makes the changes.

Negative RF feedback works far better and more quickly. This is why no modern solid state rig that I know of uses ALC feedback from the PA to control drive level; they all AFAIK use negative RF feedback, which is commonly referred to as "foldback".

Most tube-type grounded-grid amps can easily be fitted with a negative RF feedback circuit. I did it to my Ameritron AL-811, along with a bunch of other protective mods (grid fusing, anode fusing, improved low-Q VHF parasitic suppressors), for very little money invested. It's well-known to "never" drive an 811-based grounded-grid amp with more than 70 watts or your tubes will not last any time at all, but I drive mine at 100W exciter drive without any splatter or overdrive; my signal is beautiful and without the large THD that typically comes from overdriving a PA. I have even used it for digital modes and no one can tell I am using an amp except for my signal strength. I highly recommend checking out and installing the kits from AG6K if you have a grounded-grid PA.

Just some thoughts on the subject. YMMV, and of course your PA may not use tubes, or be grounded grid.

I agree. I am smart enough too that I have only hit my other Ameritron amps with 100w drive by mistake about 3 or 4 times. I got lucky that the amps were pretty much pre-tuned and no damage was done. Now that I own a REAL amp (Alpha 91b), I hope that doesn't happen again. It would be nice to have the ALC just in case I decide to be smart enough again. I believe the Alpha is protected enough to go into fault, however that quick burst of power could do some damage if the settings aren't close.

That's a really nice amp. Wish I had one. :)

I am a bit confused from their docs on the website, though... It appears that they use a variety of protective monitors and devices internally, but they also seem to be indicating that an ALC connection is required to truly protect the amp from being overdriven.

I would contact the manufacturer of the amp and ask them what they would recommend, and if there really is a requirement for the amp to be connected to an ALC port on your transceiver. They don't have a manual onsite that I could find, just the advertising blurb about the amp and compliance certifications.

The *obvious* alternative is to place an attenutor inside the the keyed circuit in the amplifier, that brings the drive level to the right level, that way you never forget to reduce your drive when you turn on the amp! AND you reduce the spikes which almost every modern rig turn out (some at the the 170W level)

I learned the hard way - now all my amplifiers (HF, 6m, 2m) are equipped with one.

I have looked through the manual for the amp and it shows that the orion can be control through the amp, but I am not sure just how. I suspect that it may be the CAT control connection. I have contacted the manufacturer for help. On SPE's web site click on the download on the left side and then click on the compliance III version to access other information including the user manual.

4977. another data modes question

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-16 18:22:58 UTC
From: Dave
Topic: 4977 Message: 4977

Hi agn to the group,
still highly impressed with the orion 11 , adio side now working very well tailored to my own voice,and now concentrating on using the accessory socket for data modes and finding some difference to previously owned radio's.
setup is as follows
computer souncard out to a small unit made by G3liv for isolating the radio from the computer connected to the 8 pin socket on the orion rear
this is where my problem starts.
previously the unit worked with all my radios,but now I have an audio in
from the computer to the orion problem.
the maximum power I can attain form the rig is 25 watts pep .
in the main menu I have setup user 2 as data modes via the aux setting for audio input, all filters are off ,all noise reduction is off, and with nearly full output from the soundcard and the orion output set to 50 watts I cannot get any higher output from the radio.
if i go to user 1 which is setup for the front microphone I get full power output from the radio.Does the radio require a very high audio input on the acc socket or am I missing something obvious??
regards
Dave

I get the impression that it simply set up its output pi network pre-set and any input network settings based on the frequency polled from your Orion (assuming it speaks "Orion"), but the manual doesn't specify and the brochure implies that there may be direct amp control of the RF power output control on the Orion via the RS232 interface...

Hope the company can answer for you... Otherwise the attenuator sounds like a decent method of controlling things for proper drive. Of course, no worries about damaging the radio or the amp from overdrive, as it has plenty of internal self-diagnostic and failsafe strategies, and seems like it would be pretty hard to kill by accident (key-down into the wrong antenna, a bad piece of coax (within certain limits of immediate VSWR at key-down), and the like). Really, your main worry in overdriving that amp would seem to be nothing more than "splatter", if I am reading the manual correctly. So maybe just adjusting your TX power setting on the Orion will suffice, as there appears to be so little to worry about from the amp being somewhat overdriven.

4982. Power Source of my Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-20 22:36:45 UTC
From: wv8bob
Topic: 4982 Message: 4982

I just purchased an Orion II. I am getting reading to connect my power supply to the provided DC power cord that is provided with the radio. I have a concern that I must admit I have not given much thought to when connecting a Vdc radio to a Vdc power supply. Typically one would connect the + cable of the power supply to the + of the radio cable connector and - cable of the power supply to the - cable of the radio cable connector. Here is my silly question. I check the voltage from my power supply with my digital voltmeter and saw -13.8 volts. I connected my supplied radion power cord and rechecke the voltage and saw the same -13.8 volts on the meter. The manual says that I should have +13.8 Vdc nominal for 100 watts output power. The supply voltage can range from +12.8 to +15.0 Vdc but +13.8 Vdc is the optimum value. Of course if I reverse my cables I can get the + voltage described in the manual, but I am not + to + and - to -.

Help. I don't want to smoke my Orion II.

Thanks,
Bob

Hi Bob,

First of all, make sure that you have the meter polarity hooked up properly to the power supply connection. If the meter + lead is connected to the power supply + lead (usually RED) the meter will show +13.8 or whatever its output is. Make SURE that the +positive of the PS is connected to the + positive of the radio again normally RED.

As for the 13.8 V, that is the voltage used by manufacturers to arrive at their equipment specifications.

I suggest that you connect the TenTec Orion II power cord FIRST to the power supply while it is DISCONNECTED from the radio. Then measure, with your meter leads at the proper polarity, right at the end of the plug to make sure the polarity is correct.

Thanks Tony I knew I had my connections correct. I thought about my meter connection right after I submitted my posting, but I was working on a dryer installation and just got back to my computer and read your reply. The reason I suspected the meter was that my nephew was play with the meter today and he had switched the leads. Bless his little heart. He also turn my mic gain control off while I was working on making room for my Orion II and I looking for that problem everywhere in my audio chain because that was part of the equipment I had moved. Finally I connected my stock mic into the front of the radio and that's when I discovered the radio was causing the problem. I soon discovere is little deed. Thanks for the information anyway.

Bob

4987. Monitor setting jumps

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-23 07:54:30 UTC
From: Martin
Topic: 4987 Message: 4987

Using my Orion in the BARTG contest this last weekend I was constantly plagued by an anoying jump in the monitor level. What I found was that having set a comfortable monitor level if I then adjusted the receiver audio level then on the next transmission the monitor volume would be at what sounded like maximum, a slight touch of the monitor level imediately dropped it back to the original level. This is a 565AT running 2.062a (I think) in FSK mode. Anybody else see this?

4990. MOX button on Orion 1?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-23 15:40:21 UTC
From: eduardomontana
Topic: 4990 Message: 4990

Hi all,
I have an Orion 1 with the hardware mod to version 2. I love the radio.
The only thing I can't do; which is usefull for me is to press a fron pannel button to transmit in SSB.
I know I could accomplish this many different ways; I don't like using VOX and I'd like to avoid any additional PTT.

Is there a button or can one be assigned to transmit while in SSB?
(ie: press it to transmit, press it again to receive?)

I'd guess by now you might realize that my style is closely related to that of a rag chewer ...

Any help, greatly appreciated!

Eduardo,

Set the CW jack to PTT in the Menu under CW. Then you can use your key as a PTT switch. That is what I do for Field Day when I am using my head set and want to avoid VOX because of noise in the operating area.

Bob, I run both pieces however the units should be set up for your voice. The settings I have are taylored to my voice but are as follows:

== 8band==
50 - +12
100 - 0
200 - -5
400 - -4
800 - -4
1600 - +4
2400 - +6
3200 - +14

==EQ Plus==
EQ = On
Bass - 12 O'Clock
Treble - 12 O'Clock

COMP/DE = On
Comp - 12 O'Clock
DE Level - 4 O'Clock (must be set to your surroundings)

Audio Input - 600 ohm w/Heil Gold Line
Mic Pwr - Off

GAIN - 1 O'Clock (your mic may vary)

EFFECTS - #1
Delay - 2 O'Clock
Level - 2 O'Clock

OUTPUT LEVEL - 2 O'Clock
==========

Julius has my setting on file, probably hasn't made his cheat sheet yet.

Watch your controls under the 8 bander, they are CRITICAL !

==========

I'm on 3.933 almost every early morning from around 1-2 AM until 6 AM. There are a bunch of us that run the W2IHY equipment in the Black Sheep Lounge. Stop by and someone will help you adjust the unit as it's almost impossible to do it yourself (can't hear yourself).

I use my CW key as PTT for my 5 dollar computer mic hooked up to the aux input. Don't know if that would work for you. If you have a computer in the shack you could run a serial cable to the Orion and use something like Ham Radio Deluxe which has a PTT button on it that will key the radio until it is clicked again. Or maybe homebrewing something that can be plugged into the CW jack on the front panel with a switch or button in it that can just be plugged in whenever needed. I kinda like that idea. I will head to the junk box store in the morning to see what i can come up with. I will keep you posted if interested.

Is there a button or can one be assigned to transmit while in SSB?
(ie: press it to transmit, press it again to receive?)

I'd guess by now you might realize that my style is closely related to that
of a rag chewer ...

Any help, greatly appreciated!

VE3YZR.
Eduardo Montana.

> I use my CW key as PTT

As do I. An inexpensive key with a shorting bar will prevent any necessity from holding the key down if you go that way. Personally, I'd like to have a PTT button that I could run inline with VOX, so that it would only key up with my voice when a foot switch or CW key was pressed, which would (IMHO) give me the best of both worlds. I could do that by using the VOX button above the display, but *I* would rather have it be external, or at least switchable between the on-panel button and an external switch.

Wish I could combine that with the MOX request... IT's pretty much two sides of the same coin in a lot of ways. Now if I can just get Ten-Tec to share the source code since they appear to no longer be updating the firmware on the 565... ;) (Perhaps I will have to beg via email for a while and see if I can get some files in exchange for no longer bugging tech with email requests... ;) ;) ;)

5004. Sub Receiver Frequency Range: 500 kHz-30 MHz

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-25 00:47:48 UTC
From: wv8bob
Topic: 5004 Message: 5004

The sub receiver range is consided to be General coverage ranging from a frequency range from 500 kHz to 30 MHz. However, I was trying to tune down below to aroun 1500khz and the sub receiver stop at 1790khz.
What am I doing wrong to get the sub receiver to cover the general range as descibed in the manual.

Another question relating to the sub receiver. How do I get the band pad on the upper right side of the front panel to work with the sub receiver.

Thanks,
Bob

I'd be willing to bet that you have somethign else besides just the sub-receiver assigned to that VFO. The Amateur rcvr and xmtr both stop tuning down on 160m when you get to 1790 kHz.

Either deselect the TX on both VFOs or select TX and RX for the VFO that is NOT associated with the SUB RX (or vice versa, dependning on your viewpoint; I typically leave TX and RX on VFO A and SUB RX on VFO B), and you should be fine to tune your Orion down well below 1790 kHz. Mine appears to tune all the way down to 100.1 kHz.

> Another question relating to the sub receiver. How do I get the band pad on the upper right side of the front panel to work with the sub receiver.

Pree and hold the A/B button until the highlighted A (to the right of the MON button) changes to non-highlighted, and the non-highlighted B (to the right of the SP button) becomes highlighted. Then you can use the band change quick-change function of the band pad keys to quickly jump around on VFO B. Of course, you can always direct enter frequencies into either VFO, as they each have their own direct entry key.

Nope, those are connected directly to the main rcvr, AFAIK. Would be nice... But potentially very confusing, which is probably why they made it non-adjustable. Imagine if you switched it and forgot... No end of hair-tearing!

Make sure that the sound card settings are correct for the microphone. I know with a microKEYER you have to select the correct sound card driver in Windows Control Panel/Audio.

Hello

Is there a way to hook up an external receiver with the Orion? That is to use the Orion as the transmitter and use an external receiver for the receiver. The Orion has a great receiver but I have been using it on AM phone, I get fantastic signal reports with excellent audio. I would like to hook up a NC 183D to use with the Orion when conditions are not crowded. Wonder if anyone has any ideas on this.

Thanks 73 Tim

The N4PY Software for the Orion does this with some external receivers - not sure if it supports the NC 183D. The N4PY website is www.ralabs.com/n4py Carl the author of the software is pretty responsive to emails.

I have no real need for it, but there are several HF rigs that have general coverage transmit mods out there. I have yet to see one for the Orion rig. Does one exist or is this a well keep secert? I know that Ten-Tec will do the MARS mod if you have the proper license.

Just curious,
Bob

Howdy Bob. TO my knowledge, there is no general coverage mod for the Orion I or Orion II. I spoke with TT when I purchased my OII and they offered nothing due to the design of the radio. I use my OII for MARS work and it goes out of band enough to cover many of the frequencies that we use. A work around is to use Ham Radio Deluxe. It will take the OII to wherever you want to go - both receive and transmit. Hope this helps!

That is really amazing to know about the Orion. I have used HDR for a long time, but never every thought about that. Is this true of other HF rigs or just the Orion? Who would have thought this? I was shocked when I discovered that you could totally open up some of the later models of the Ft1000MP and Mark V with a menu setting, but this floors me..

Thanks for the heads up.

Bob

From: Dave
Topic: 5023 Message: 5023

Hi,I am using hamradio deluxe with my radio and seem to have a strange fault,when using hrd to control the radio everything works fine,
if I start using dm780 for psk31 the programme works ok but keeps losing contact with the radio readout from the main programme and I have to reconnect the radio from the radio popup panel from within dm780
the main hamradio programme does not lose contact at any point with the radio.
I am using Vista 64bit operating system
regards
Dave

It's roughly the same difference as moving up from
a 500-600 watt amp to a 1500 watt amp on SSB, as the
#715 does raise the average power level on SSB.

I've got a peak reading LED wattmeter and watching my Orion consistently drive maximum output throughout a spoken message with its native speech processor. Compression is already optimum. The meter doesn't lie. In this case, the 715 will yield an additional 0dB, not 4-5dB.

Re-read what I stated ... AVERAGE ... I ran tests with
an Orion II and the same again with a FT1MP using an
average/peak wattmeter and watching the RF on a scope
... as I was very skeptical too at first.

I also compared the respective stock <internal> compressors
with and without the #715, the #715 still raised the average
power levels.

It's not magic, and only helps on SSB, but still, if one
can't run an amp, or enjoys QRP ... there could be value.

I think they broke something in the v2 firmware and the 715 fixes it.

Seriously. I agree that the processor on my 1KMP was suboptimal.

I guess the twin questions are;

A) Does it do anything that the built-in speech processing on the 565 does NOT do?, and

B) Does it do anything that the built-in speech processing on the 566 does not do?

If it is (as I suspect) the same circuitry that is in the 566, and possibly the same that is in the 565, then spending money to have the same thing twice, to no useful benefit, would not be warranted. Now, if it had some advantage over the speech processing, whether used alone or in combination with, of the 565 or 566, then it would be a discussion point. Since I've found that it is quite possible to turn up the speech processing on the 565 "too high" and end up with worse copy on the receive end than with lesser settings, if itis the same circuitry as in the 565, I'd consider it money wasted since I already own a 715 (inside my 565!). If it can be used in conjunction with the 565's internal speech processing, or in place of the 565's speech processing, to better effect, than it might be worth buying.

YMMV.

Hello Orion Fans:

The processor in the Orion II is a RF Compressor, not an RF Clipper. The advantage of the RF Compressor is that it avoids distortion while increasing the RMS average power output of the radio. The RF Clipper is highly effective in raising the average also, but at higher compression rates it will introduce some distortion.

The issue in the Orion II in my opinion has always been the adjustment of the compressor. It requires at least 15 dB of compression to begin to significantly raise the RMS average power. The Ten Tec instruction manual does not address the need to adequately drive the compressor with sufficient audio gain, and the ALC led is not a good indication of sufficient drive for the compressor.

I have posted on my website a method for adjustment of the compressor which will result in excellent audio quality, with a realistic gain in average power, which will be clearly heard on the receiving side.

Please visit here to view the adjustment procedure:

http://home.earthlink.net/~cherokeehillfarm/id2.html

5032. which release 2 firmware are you using on 565 (orion 1)?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-03-31 18:13:20 UTC
From: pa1ap
Topic: 5032 Message: 5032

Greetings,

After going back and forth between release 1 and release 2 I finally landed on using 2056.

For the ones using release 2 on 565 (orion 1), could you share your findings? Which firmware do you prefer and do you notice agc clicks or am I the only one? Using the rig on 80 meters most of the time (ssb) with agc on slow or prog with duplicate of slow with small hang time and higher threshold to match band noise.

In my observation, versions after this (2057 and higher) introduce an agc click which can be best described as static noise when signals are loud combined with the volume knob at higher level. It also clearly shows on the audio FFT analyzer connected to the rig. I can upload audio pictures which clearly show the static overshoots. Its seems the later releases have an very aggressive AGC which can be made a little softer by introducing hang time combined with a low decay value... however it doesn't remove the static noise (clicking) sound completely.

And yes, I am also looking forward to the new release 2 software!

Thanks for advice and regards,
Onno pa1ap

I have uploaded a document into the files section which contains the pictures illustrating the agc clipping and resulting distortion / harmonics.

best regards, Onno

Haven't tried any others, though I might. I notice a number of annoying bugs and issues with 2.062a.

> and do you notice agc clicks or am I the only one?

No, they are quite clear. With AGC engaged, I can hear a click every time I shift the AF gain control with signal or noise above the AGC threshold on SSB, any band.

I need to read more of the archives from around the time that v2 came out and the various flaws found in each version, but I have significant problems with reception in AM mode (I do better receiving AM stations in either sideband mode, although I get great transmit audio reports ("Are you using a plate-modulated tube rig?")), and the built-in NR is next to useless for reducing noise but keeping intelligible voice data, often even at the lowest settings. I will look for further guidance and possible solutions in the archives so as not to re-hash old business (although I certainly would welcome on- or off-list info on either major issue I have with the runtime code in 2.062a (and possibly other versions).

5035. Question: RX Antennas and use of AGC/RF Gain....

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-01 01:34:07 UTC
From: Brad
Topic: 5035 Message: 5035

So I have about 8 different antennas I use for 106m and 80m. My typical behavior is to pick the best antenna for the conditions, etc. I am wondering how folks balance the adjustment of RF gain or AGC threshold given that different antennas can have different levels of noise, gain, etc (which would seem to need different AGC thresholds or RF gain settings to manage the noise levels)? To sum up my dilemma, I don't like fiddling with controls during a contest and am wondering how people handle this type of scenario given that different RX antennas can produce different levels of noise?

One thing for sure, my FT-1000D seems a lot easier for me to handle in this type of scenario. I have yet to use my OII in a contest for this reason and for the fact that I have to tweak RF gain or AGC threshold to manage noise when switching from band to band.

I guess the same question is applicable for those who may switch from a vertical to a dipole of a vertical to a beam - all generating different needs on RF gain AGC. This seems like a pain in the butt balancing act. Maybe I am missing something? I'd like to make the jump permanently to the OII but am stuck on the ease of use of the 1000D for my contesting. Any thoughts? Someone else must have been through this....

Thanks,

Brad

Brad,
With all the different setting the AGC has to offer it's easy to be overwhelmed by the possibilities. I was at first and was constantly adjusting the AGC settings. But, I finally settled on some settings for slow, med, fast, and the programable positions which seem to give me good performance for many different conditons without having to make adjustments. If you're interested in those settings you can e-mail me directly and I can send you my numbers.

5038. Optical encoder failure?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-01 07:50:10 UTC
From: Adam Wade
Topic: 5038 Message: 5038

I have a recent acquisition reman 565 from Ten-Tec as noted previously. From the time I received the rig, the MULTI knob has been balky -- sometimes not responding to incremental turns, sometimes jumping several steps ahead for each detent, and sometimes going a BACKWARD for a detent followed by a forward. This is random but fairly frequent; it's gotten a little worse over time, perhaps 20% of detents engaged resulting in something other than a single detent increment/decrement as commanded.

I have found recently that the MULTI knob has the momentary push feature the same as the other rotary encoders, but doesn't do anything; if I grasp the knob and manually pull it toward me while rotating the encoder, it seems to be 100% consistent in the correct response to detent inputs.
Is this an impending rotary encoder failure? Could it be a dirty encoder? Can they be cleaned, or is this simply a matter of replacing it? And which of the other encoders are the same, and which are different? I know the v2.x firmware required a replacement of the RE for the RIT control. Since I essentially never use RIT or XIT for much of anything, and rarely use the subreceiver (partly due to the fact that it is still flaky, and partly due to the fact that I seem to be able to get around just fine by simply switching between VFOs and using memory "channels" as needed), I could conceivably just swap out the RE from the Multi control to another, pretty much unused position on the panel if need be. Of course, looking at the work involved in gETTING to the REs to change them out, that would probably be a false economy in terms of labor.
I'll hunt the archives for further information on RE failure modes, but if anyone has additional input, I welcome it, on- or off-list (even if it's just a pointer to something I missed in the archives or on the web -- a search brings up a lot of info on the RIT RE replacement for v2 firmware, but so far I've not really found much else).

Greetings,

Please check the wiki on ten-tec, there is a chapter on this issue and possible fixes. It sounds like the encoder is defective, certainly if the push function isn't working. The push button should work reliable.

You can test by changing a value in the menu to something extreme and then after pushing the multi knob for a couple of seconds (manual refers to 2 sec) the value should return to its default value. Example could be threshold within the AGC setting, move the selection to threshold (it will be highlighted), turn the multi knob and set value to 192 (or something like that)... then push multi knob for 2 second and it should return to 1 or 3 depending on software being used.

Of course you have to realize there is certain priority in the operating system. when you turn the VFO knob (high priority) the processor will not serve (poll) the other knobs until the VFO knob is stable again. It isnt possible to turn the VFO and at the same time change for example the filter bandwidth.

Perhaps best is to contact Ten-tec service and discuss sending a bunch of encoder switches and replace all of them at once. That is if you are comfortable replacing them yourself.

Apparently the previous owner used some force when pushing/pulling the knobs causing the encoders to behave eratic.

hope this helps, Onno pa1ap

Adam -

Check the Ten Tec Wiki for the articles on the RIT encoder problems. Turns out to be connectors that go to the display board. Reseating the connectors, bending pins, cures that problem and may cure yours. Costs nothing to try.

From: John T. Fleming
Topic: 5038 Message: 5041

All that is needed to fix the problem "for a while" is to apply pressure to the front of the case between the sweep button and the LCD display. That is enough flexing to make the connection of the marginal connector between the encoder board and the CPU board good again. The problem pins and connector are located by the sweep button. Ten-Tec evidently got a batch of marginal connectors when building a run of the radio and with age, the oxidation becomes a problem. It is a major challenge to change the connector.

73,

John

From: Bert Beyt
Topic: 5038 Message: 5042

The encoders on the Orion front panel are not like normal potentiometers which have a shaft protuuding through the front panel which is connected to a wiper. These little encoders are two separate pieces, the shaft is not connected to the body. If you open the rig and drop the front panel, you will find the knobs and their shafts remain on the front panel, and the body of the encoders are on a small pc boards; two separate parts not mechanicaly connected.
So I think your problem is typical of Orion encoders that do not work properly. The space between the knob and its shaft is not set correctly to the encoder body. This is probably best adjusted by the Ten Tec service department. I had my Orion One all apart trying to adjust my RIT/XIT encoder, and was unable to get it set until I sent it back to TT.
Good luck.
Bert W5ZR

On Apr 1, 2009, espresso_doppio@... wrote:

I have a recent acquisition reman 565 from Ten-Tec as noted previously. From the time I received the rig, the MULTI knob has been balky -- sometimes not responding to incremental turns, sometimes jumping several steps ahead for each detent, and sometimes going a BACKWARD for a detent followed by a forward. This is random but fairly frequent; it's gotten a little worse over time, perhaps 20% of detents engaged resulting in something other than a single detent increment/decrement as commanded.

I have found recently that the MULTI knob has the momentary push feature the same as the other rotary encoders, but doesn't do anything; if I grasp the knob and manually pull it toward me while rotating the encoder, it seems to be 100% consistent in the correct response to detent inputs.

Is this an impending rotary encoder failure? Could it be a dirty encoder? Can they be cleaned, or is this simply a matter of replacing it? And which of the other encoders are the same, and which are different? I know the v2.x firmware required a replacement of the RE for the RIT control. Since I essentially never use RIT or XIT for much of anything, and rarely use the subreceiver (partly due to the fact that it is still flaky, and partly due to the fact that I seem to be able to get around just fine by simply switching between VFOs and using memory "channels" as needed), I could conceivably just swap out the RE from the Multi control to another, pretty much unused position on the panel if need be. Of course, looking at the work involved in gETTING to the REs to change them out, that would probably be a false economy in terms of labor.

I'll hunt the archives for further information on RE failure modes, but if anyone has additional input, I welcome it, on- or off-list (even if it's just a pointer to something I missed in the archives or on the web -- a search brings up a lot of info on the RIT RE replacement for v2 firmware, but so far I've not really found much else).

The speech processing in the Orion 565 V1 code and V2 code generates
very close to a 6dB increase in the average power with speech. I posted the following
post on the Ten-Tec reflector. By the way, the ALC light is rather meaningless when
the compression is turned on. On the air tests have verified
that the speech quality, even at settings of 8 or 9,
is very good. All tests were run with the CW key-down power set to
39W. The SSB peak power was 39W with the average power measured at
26W in one case and 31W in the other case. Any processing above this
level would begin to cause significant loss of speech intelligibility.
Summary, the Orion 565 V1 and V2 speech processing is just outstanding!
(Early V2 code versions had problems)

I ran tests on the Speech Processing effectiveness of the V1 and V2 code from
the Orion on 29 May 2007. The results are below. It will be interesting to see
how the results could be any better with an external compressor - of course you
can turn down/off the internal Orion compression, greatly reduce the mike gain
or even change the speech compression code.

Doug Smith, the major author of the V1 DSP code, wrote the following about the
speech compression in the Orion:

"It might seem funny but in a DSP transmitter, it is relatively easy to compute
the transmitter's RF envelope before the modulation is even performed! That, in
turn, makes it possible to preprocess the audio applied to the modulator to get
exactly the same effect as that produced by an RF compressor. See Fig 5.
Post-modulation band-pass filtering maintains the desired occupied bandwidth.
As the decay time of the compressor is decreased, an RF compressor approaches
the behavior of an RF clipper, long known to be the most effective form of
speech processing for SSB. In combination with the Orion's transmit equalizer,
results are quite dramatic.
The reason RF compressors and clippers are so effective is that they increase
the average power transmitted. Human voices tend to have high peak-to-average
power ratios-- as high as 15 dB. That means a transmitter whose peak envelope
power is limited to 100 W may achieve an average power of as little as 3 W.
Under such conditions, the Orion's RF compressor may add 10 dB or more to the

average power, equivalent to a ten-fold increase in output power. The speech processor achieves this goal without introducing the kind of distortion that harms intelligibility, such as that created by heavy audio compression or clipping.

Text of Previous message on Orion SP testing:
Text from previous note
http://lists.contesting.com/archives//html/TenTec/2007-05/msg00478.html :

Although the Orion V2 code still has some problems/issues with performance, one area that appears to have been addressed in the V2.06X releases is the speech processing performance. Earlier versions of the V2 code suffered from a combination of audio distortion and weak, if any, compression. The V2.06X releases clearly sound like the distortion has been addressed and that the compression is much improved. I recently bought an LP-100 Digital Vector RF Wattmeter from Larry (N8LP) http://www.telepostinc.com/lp100.html . Among the many functions provided in the LP-100, Larry recently added new code to allow the user to measure the "effective audio compression" of a transceiver. The technique uses an audio test tone pattern (the one I used had a 1KHz tone with alternate 50MS time segments with the levels 20db apart).
The RF power meter samples the power level 40,000/second to generate average value. I used an "audio sound power meter" to measure the audio level of my voice calling DX and then used the sound power meter to set the test tone to the same level (Using a single level tone) into the microphone.

I tested the V2.062a code and got the following results:

Proc Setting - Audio Result - RF Result Average Power
Off Slight Expansion ~8W
1-4 Close to no compression ~9-10W
5 ~5dB Compression ~12W
6 ~5-10dB Compression ~13W
7 ~10dB Compression ~16W
8 ~10-15dB Compression ~20W
9 ~15-20dB Compression ~26W

I tested the V1.373b5 code and got the following results:

Proc Setting - Audio Result - RF Result Average Power
Off Slight Expansion ~8W
1 - 4 Close to No Compression ~9-10W
5 ~5dB Compression ~12W
6 ~5-10dB Compression ~14W
7 ~10dB Compression ~17W
8 ~10-15dB Compression ~24W
9 ~15-20dB Compression ~31W

In all cases the peak power stayed very close to 39W - which is what I use to drive my Alpha 87A to 1500W peak output.

As you can see from the results they track very closely - so closely that they almost look like the same algorithm! There is a slight difference at the 9th level on the Speech Processing but it is very minor (And might be altered if the mike gain were increased). At a Speech processing level of 7 the talk power is doubled from the level with the Speech Processing off. At the 9th level there is roughly a 6dB (1 S-Unit) improvement in the talk power of the rig. I usually stop at eight but there is no audio "background noise level increase even at 9 (Maybe a very little hum). The audio sounds very good in the monitor and the quality was verified by a friend. The talk power improvement is very important in trying to work SSB DX.

I think the Orion V1 code has the best Speech Compression I have ever seen in an HF radio and now it appears that the V2 code matches it! Thanks Ten-Tec!

> the LCD display.

I'll be doggone if that didn't take care of it! Of course, it caused another problem -- now the pushbutton action for the H/L cut control doesn't switch between the two. ;) I only ever use low cut anyway, preferring the BW knob for changing the high cutoff, so I can live with that. ;)

> That is enough flexing to make the connection of the marginal
> connector between the encoder board and the CPU board good again.
> The problem pins and connector are located by the sweep button.
> Ten-Tec evidently got a batch of marginal connectors when build-
> ing a run of the radio and with age, the oxidation becomes a

A little disappointing that it arrived with this problem direct from Ten-Tec upon purchase, but it sounds like ti may well have checked okay on the bench and had the marginal issue become "visible" after handling during the shipping process.

If I go to the trouble of completely disassembling the front face of the radio once things get to be too much of a pain to tolerate any longer, will something like using DeOxIT products on the connector be sufficient to clean and protect the contact surfaces for another bunch of years, or is something more drastic required like replacing the connector?

I'm glad that it isn't a dying encoder, altohugh they might actually be cheaper than I imagine they are. :)

Many thanks to all who replied and made suggestions! If I have future failures and they turn out to NOT be oxidation, I definitely have a list of good things to look at and try. I'd rather have too many diagnostic options than not enough!

5051. Aux output bug?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-09 03:29:31 UTC
From: Adam Wade
Topic: 5051 Message: 5051

Just noticed something that I think is a firmware bug on my 565.

When I turn the volume most or all of the way down, I get white noise from 0 to about 3400 hz out the aux output on the DIN connector on the rear. This also happens when I mute the audio. Up to about 15% volume the noise decreases with an increase in volume, and goes away entirely above that volume level. This is easiest to see and hear if you use the DSP filters to give a very narrow BW and then turn down the volume. The aux output then shows white noise from 0 to 2400 hz, very clearly audible and visible on a waterfall display outside of the DSP filter's BW.
Is this a known bug? Do I have some sort of other problem that's causing this? Any info would be appreciated. :)

Greetings,

I am not sure I understand the issue you found. To my knowledge the output on the din plug and line out connector (which i use) works independent of the volume control at the front panel.

If I disconnect the antenna i do see noise which is expect and it follows the filter curve nicely.

Could you share what and how you are testing something?

It is supposed to, yes. That doesn't appear to actually be the case, though.

> If I disconnect the antenna i do see noise which is expect and
> it follows the filter curve nicely.

I can't comment on antenna connection in this case. This was noted with the antenna connected at all times. The problem does not, however, follow either the xtal or DSP filter settings.

> Could you share what and how you are testing something?

Not quite sure how to make myself more clear...

With volume at half or more, connect DIN plug to computer via isolation xfmrs or direct. Open software with waterfall display. Switch to narrow xtal filter and DSP settings. Set computer to pipe audio in from Orion through computer speakers. Now turn the volume down on the Orion. As you get near to 0 volume, you will see on the waterfall and hear from the computer speakers white noise from 0-2100 hz (I thought it was 3400, but may be mistaken -- it's 0-2100 now, but possibly changes?) that increases as the volume is lowered to 0. This also happens when you mute the audio output by pushing in the vol knob on the Orion. Now change xtal filters and play with the DSP bandpass filters and note that the noise does not change its freq range.

Greetings Adam,

Interesting challenge and i can not reproduce it. Perhaps a silly suggestion but worth checking;

In the audio menu you can decide both/main/sub for the speaker... Check what you have marked, since the output to the din plug follows this setting... It might be that you have selected "both" which means main and sub audio is send to the din plug.

Hope this helps. Best regards, Onno

I feel slightly stupid. :) The DIN connector has a left and right channel on separate pins, and follows the headphone left and right settings rather than the speaker setting. And I did indeed have the headphone setting on "Both" for both left and right channels. Setting it to "Main" made the problem go away. Also, setting the speaker to "Main" with the headphones on "Both" gave both rcvrs into the DIN port as expected.

So I've gotten the results I want, but it is still a mystery to me why I would only see the main rcvr's output with all three audio channels set to "Both" and the volume turned up, but would see both channels on the DIN plug when I turned the volume down into the speaker (I've been using headphones plugged into my speaker lately, and not using the binaural options for the headphones, so it's easy enough to avoid the problem -- however, it's still not behaving properly, and I don't know why...) It shouldn't have ever behaved this way; I should always have seen both rcvrs in the DIN plug audio at the same levels, but only now noticed the problem because I almost always monitor rcvr audio when running digi-modes by using phones or my external spkr.

I've also started having a problem where the MON level turns itself up to booming, painful levels in my 'phones periodically. Pressing the MON button to turn it off and then back to on again makes it return to my regularly set level. The MON setting number never changes, just gets terribly loud. Not sure if I am doing something that triggers this behavior, but I'll try to keep an eye on it.

Subject: [orion565] Firmware Version 2.041XL

Hi Folks,

I looked back a bit but may have missed the posting. Has anyone had problems with the new beta firmware? I just happened to look at the Ten-Tec download site and am trying to decide if I should upgrade from Version 2.039d on my Orion II.

73,
Bill

5061. Mon level bug, 565 -- more details

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-10 23:51:34 UTC
From: Adam Wade
Topic: 5061 Message: 5061

Well, I've played around a bunch and narrowed in on the Mon level issue. It only happens through the speaker output, which is why I never noticed it before... If you leave Mon turned on with any speaker, it'll feed back, so 99% of folks would never notice it. I have an external speaker with several audio filters built in, and just started using the headphone jack on the speaker so I could access the pushbutton audio filters at will.

Any change in volume level with the Mon on and set to any level will result in 100% Mon output through the speaker. Turning Mon off and back on again will reset it to the correct level according to what you dialed in for a Mon level. Touching the volume control for either main or sub rcvr will cause the Mon level to hit 100% again even though it still indicates the lower level I set previously. I tried re-uploading the firmware and a master reset to see if it was something I had done or a fluke of bit rot inside the EEPROM, but no change.

Guess I go back to using the headphone jack on the radio... Sure would be nice to get a bug fix firmware update for the 565 someday. There seem to be more than a few niggling bugs floating around (I think I have found at least 3 or 4 that stick out, and I believe more have been noted on this Yahoo group). And honestly, Ten-Tec's selling point of "always have the latest for your radio via internet download" is starting to feel really thin, with a year and a half having gone by without a firmware update. If the radios are only going to get bug fixes for the first four years, that should be disclosed, IMHO, and I'm a lot less likely to buy another Ten-Tec firmware-upgradable radio if they stop supporting them after only 4 years. That's an awful lot of money for something with some (to me) significant faults that aren't being corrected... T-T service might wish to check this Yahoo group to see commentary on the other flaws and bugs in the last
available firmware update. I'm not expecting Ten-Tec (or any manufacturer) to provide free extra features in perpetuity, but sorting out the bugs in the code so the radio works as intended seems to me to be a reasonable expectation when buying a product. If I buy software with bugs in it and they don't get fixed, I have always gotten a full refund from the company (just did that with some Blu-Ray player software that was sold to me for use with my OS, and was having problems, and the company eventually revealed to me that they don't support the OS I use (XP Pro x64), so they refunded me in full), or they have provided a no-cost bug fix. While I acknowledge that handling SDRs requires a quantum leap in support and design thinking for a company that formerly just provided hardware, I also think that a company that's selling a package of software and hardware needs to fix the bugs in the software to make the product reliable and solid -- especially
since I just bought the radio from them a few months ago! Granted it's not a "current" product, but they sold it to me direct as a refurb, and if they are selling the product direct in any fashion I would expect them to support bug fixing in it at a minimum.

I saw where someone online stated that Ten-Tec is planning on releasing a firmware update soon, but that's the first I've heard of it. Rumor? Or some long-awaited bug fixes? I certainly can hope for the latter...

And as an aside, I have otherwise been more than totally satisfied with the radio (except for the DSP noise reduction, which is pretty poor compared to most other DSP-equipped

radios I've tried... My FT-100D blew it away hands down), love the full adjustability of nearly everything, and would not give it up, especially at what I paid for it. Having received it with a flaky optical encoder, an old manual, and buggy firmware does disappoint me a bit, though. Maybe it's like buying a Maserati... Tempermental and somewhat nigglingly buggy was "part of the charm" that you paid for when buying one back in the day. *sigh*

5062. Barrowed Orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-11 09:39:29 UTC
From: kd6hq
Topic: 5062 Message: 5062

I will be barrowing a 565 tomorrow to become familiar with the radio before I purchase one. The radio has been setting in a box for the last 2 years unused and no the owner will not sell it I ask. The owner has asked me to upgrade the firmware. This is an original Orion. It was purchased when first offered by Ten Tec and has never been updated. I have looked on the Ten Tec web page and downloaded 1.372 firmware but can not find the program to load the *.ruf file into the Orion. Where can I find the program please?

I also mentioned the Version 2 upgrade. He asks me to ask if there were any disadvantages to the V2 upgrade. Does it degrade the receiver performance in any way? He operates both CW & SSB.

Thank you

Don

Please disregard my previous post.

1. I've done enough reading tonight to figure out the update process.

2. From what I can tell the V2 mod does not seem to degrade the
receiver performance.
Unless you think that I've come to the wrong conclusion.

Don

> go away.

I spoke too soon. :D Seems the problem is dependent on whether I am listening with headphones or through the speaker (I can only assume that this is because the headphones and the DIN connector share the same audio path, at least prior to the audio amp and vol control).

With headphones plugged into the phones jack on the front panel, and the headphone left and right set to "Both", either channel is muted when the volume for that channel is turned all the way down or the muting center-press of the corresponding volume knob is done. If the volume control for that receiver is anywhere above 0 (whether the 0 level is from turning it all the way down or muting), it is full strength in the DIN connector. This kind of makes sense, so you can switch back and forth rapidly between audio from either receiver without having to go through the whole menu business for audio selection, and I assume it was intentional.

With headphones unplugged and audio going to the speaker (I checked, it makes no difference whether it's the internal or an external one), however, things are not the same. With left phone, right phone and speaker all set to Both, and with both volumes turned all the way down, I get line level audio out from the DIN connector from both receivers. If I turn one up, though, the other receiver fades out of the signal path through the DIN plug and disappears. Turning up the sub-receiver volume makes the main receiver signal fade out and disappear from the DIN output, and vice versa. Turn them both up, and you get both of them out of the DIN plug again. In playing with the controls, it's the DIFFERENCE between the volume settings that determines the balance between main and sub receiver; if both knobs are set to the same level, you get line level from both receivers combined; if one control is more than about 1/3 of its range higher than the other, only that channel comes through, at line level.

However, if you change the speaker setting to either Main or Sub, rather than Both, then the DIN connector outputs both receivers at line level at all times.

All of this, of course, is with the headphone left and right set to "both". I have confirmed that changing the setting for left headphone also controls the left channel in the DIN, and the same for the right.

If you set the headphone channels to one receiver or the other, the behaviors are all exactly the same except you get no audio from the receiver that's not enabled for that channel... So if for instance I set the headphone channels to Main, with no headphones plugged into the phones jack, I get line level audio in the DIN connector from the Main receiver if both volumes are turned all the way down; if I turn the sub-receiver volume up, the audio on the DIN connector fades out and disappears. If I then turn up the main receiver volume, the audio fades back in, reaching line level as the volume controls are at

equal settings, and staying at line level is the main receiver volume control stays at or above the level of the sub-receiver volume control, no matter how low the sub-rcvr control is set.

I'm really not sure what to make of all of this. There doesn't seme to be anything in the manual that indicates that any of these behaviors should exist at all, as near as I can find. I just reflashed the firmware and did a master reset today, and the behavior is all still here. And I re-checked all my cabling between the Orion and computer to make sure there were no phase issues, miswiring, etc.

Maybe, as with using headphones through an external speaker, I should just (until a bug fix?) switch over to using the Line Out jack on the rear panel instead of the L and R line outs in the DIN connector so I won't have to see these effects.

If anyone has any suggestions about anything I might be doing wrong to cause this weird behavior, or alternately can confirm this behavior in their 565 as well, I'd welcome it. In fact, if someone can point out something I've overlooked or done wrong, I'd be be quite grateful, as it would mean an easy fix!

In my opinion current ver 2.x firmware is a giant step backwards for low signal receiver performance. I suggest you stick to 1.372 or 1.373b5 assuming you want the radio to have optimal performance with weak signals and/or very crowded band conditions. Rag chewers and casual ops likely would not notice much receiver difference between ver 1.x and ver 2.x firmware. 73 bob de w9ge

I'd think twice before proceeding to perform the V2 mod on a borrowed radio. If it were my radio, I wouldn't want that level of disassembly performed. On the other hand, perhaps the owner feels you would be doing him a favor and you have the experience to warrant his trust.

I think you're actually better off just running 1.372 or 1.373b5, before or after you own an Orion.

Don,
Before upgrading to version II, there is a hardware upgrade. I am not certain how successful version 2 will be if this is not done.
Many seem to prefer version 1 because of noise reduction. One of the last upgrades to version 1 appears to be stable (judging from comments). You can try Version 2, but some features may not work if the hardware has not been upgraded.
Search the archive for ways to determine if the hardware upgrade has been performed.

I bought my 565 from Ten Tec with the upgrade. I use Version 2 - latest version and have been satisfied with it. It uses a different model for DSP than does Version 1.

The key to upgrading is selecting the proper startup conditions on the Orion. Several buttons must be pushed simultaneously at power on. This conditions the Transceiver to receive the download. The upgrade program should work properly if all modem adjustments have been
made and the transceiver has been properly initialized. Check the
version 1 program help files for proper setup.
Good luck.

Don,
I recommend that you "bite the bullet" and get one from Ten Tec.
They offer used 765s and a 30 day return policy. They upgrade their
used equipment and "check them out" before selling them to you. There
will not be any filters in them unless stated. Nor will the accessories kit be included, just a power cord. They will be happy to sell you an accessories set (which you will probably need).

You can get the filters you need on the net. Just check the reputation of the seller.

Best luck.

I've been having a bear of a time working weak signal stations with my 565, in some part because I find the DSP NR to be more or less useless in reducing noise while retaining intelligibility in speech. Interestingly, it seems to do a better job with most digital modes...

In any case, I know there were hardware changes made to accomodate the 2.x firmware.

Can a hardware-upgraded 565 run 1.x firmware? I would imagine not, but thought I would ask.

What changes were made in hardware to allow the upgrade? I know the RIT optical encoder was changed; was anything else done besides that? My 565 has to come apart to that degree anyway so I can try and solve the flaky encoder because of poor contact on the pin/socket connector strip... Anyone have an original RIT encoder they would be willing to part with? Sounds like, for my purposes, the 1.x firmware's DSP NR would be worth the effort.

What else changed between the end of 1.x firmware and the current 2.x version? I know there's a chronology listed on the Ten-Tec wiki, but mostly I'm wondering how IMPORTANT the changes were... Were there any notable bugs in the last 1.x firmware? Any notable improvements in the current 2.x firmware over the last 1.x version? I should probably know before I consider doing surgery...

Not only will a hardware upgraded (to Ver 2.0 HW) run ver 1 firmware, but from what I've seen, it seems to be a bit more stable with the Ver 2 mod put on. So, go ahead and try 1.372 or the later beta 1.373(whatever) FW and see if you like it.

Any Orion TenTec sells should have filters. It's just a question of which filters you want. The factory standard set is just fine for most any use, unless you're a competitive contester. My opinion, fwiw.

What do you think the value is for the Orion (model 565AT) with all roofing filters, antenna tuner, fan, and speaker?
Let's say about 4-5 years old. Assume perfect condition & updated by TT.
I'm thinking $2500.

Key down, my 565 draws 8 amps at 10W out. It draws a shade over 3 amps on receive.

Not exactly a "kind to batteries" field day radio, IMHO.

From: John Hudson
Topic: 5083 Message: 5083

Was there a post last year where someone changed/added some LED's to change the display color?... I'm looking to change the meter colors on my O1, AL-811H, Model 253 and Yeasu controller and I thought someone had changed their O1 display color.

If not SORRY

Thank You

John KO4XJ

Greetings,

search the forum on K4QO. he has used "gells" to change the displacy color to light yellow, just like the s-meter. There are also pictures of this within the photo section on this forum page.

5086. Tentec after sales service

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-16 10:27:23 UTC
From: Dave
Topic: 5086 Message: 5086

I recently aquired a secondhand tentec atu for the orion 11 which had no fitting info with it, and contacted Richard at tentec uk. for assistance in fitting it.Within 3 days I received a file by e-mail
which contained written instructions and photo's of the relavent boards
showing the connection points.they had gone to the trouble of opening up
their demo radio and refitting an atu to it to give me step by step instructions,I know of no other supplier who would go to this level of customer service for a part they didn't even supply,further more
I needed new cables for fitting it and at Richerds advice I contacted the service dept in the USA.within the hour I had a return e-mail
to say that the parts would be on their way the next day with the compliments of tentec usa.
in all my 28 years of ham radio I have never experienced service like that "WELL DONE TENTEC" from a very happy user.

5087. Re: Tentec after sales service

Greetings,

I had similar very positive experience with Tentec UK and I have left a customer service review on eham.net. Its a small thing to do but it would perhaps help them to move forward in the future. With current economy good companies need even mores upport from their customers and this could support them.

Best regards, Onno pa1ap

I'm sure everyone knows about my recent experience with a flaky opto encoder for the Multi knob. I don't recall his call or name (very sorry, my memory has some medical issues), but one experienced gentleman on here knew that it was from oxidation on the pins connecting the logic board, the display board, and the switchgear and whatnot.

I was to take apart the radio anyway to add a buffer amp for a SoftRock, I figured I would see about cleaning up the pins and seeing if that helped. Yesterday I pulled the front panel and disassembled. Since I did not have any DeOxit, and I don't like leaving a mess to clean up later on anyhow, I tried out the special dielectric grease that came with my SteppIR vertical for its connectors, just packing a little into each hole in the female connectors for the front panel boards. After reassembly, the only way I could tell that the Multi encoder might have had a somewhat rough life was the free play along the shaft axis; all the controls now respond just as they should. :D
As to the SoftRock; it'll make a fine panadapter, of course, but with the new hack of PowerSDR that allows you to seamlessly integrate a FlexRadio or SoftRock with your existing radio if it has CAT control or serial port control, you get two different types of incredibly sensitive receiver with one user interface. It works through HRD (although I would be willing to bet that you can get PowerSDR and the like to work with other software as well)

Very good news Adam and I am happy you fixed the problem and shared your experience in how the problem got fixed in your case.

The conductive grease sounds like a good solution and I hope it will remain stable for a long time to go.

Take care and best regards, Onno pa1ap

5091. Re: Orion 565 (model 1) contrast issue & fix

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-21 07:32:30 UTC
From: pa1ap
Topic: 4911 Message: 5091

There is significant difference in LCD contrast control between release 1 and release 2. This causes the contrast portmeter to move towards the end of its resistance on the hot side. The cold side is around 8Kohm and the hot side is around 2Kohm. Where before it was more a neutral position, somewhere around 50/50.

The output on the potmeter towards the LCD contrast pin is around -18,2 Volts (min is +5 Volt and max is -22 Volt). Contrast is already changing if you go up/down by as small as 70mV. The potmeter has an accuracy of 20% and this might very well explain the sensitity towards temperature changes after a night of "cool" weather.

I had to replace the original potmeter since it was broken and replaced it by a better quality potmeter, although the small form factor limits of course the stability. The stability seems a little better but there is no way you can really stabilize this using a potmeter of that size.

It might be worth while to replace the potmeter for two 1% resistors to create a stable output to the lcd contrast pin.

First I will continue my search on the LCD behavior itself and how sensistive the lcd is for temperature changes. We only talk about 5-10 degrees celcius change and it seems to me a LCD screen should be able to coop with that.

> Learned through the manual that the backlight is provided by white LED's and that the -21 Volts is connected to a potmeter prior to connecting to the LCD contrast pin on the LCD module.
>
> with the recent upgrade to release 2 I learned one has to adjust the contrast potmeter significantly in order to achieve good contrast coverage through the menu setting. The question is what changed between release 1 and release 2 and right now it seems the refresh rate changed, causing a different contrast setting combined with sharper resolution. This also means the lcd screen becomes more sensitive to spikes and hashed on the contrast input.
>
> It might be worth to provide a "clean" -21 volts signal to the contrast input of the lcd screen. This would require a new dc-dc device to generate this voltage.

Hi Bob , it's been a while since I heard from you. have you made the changes to the W2IHY components and if so how is it working for you? just doing a follow-up and hope to hear you on the air. I monitor 3.668 the WAS state net on the Extra class 75 meter band. Come down and join us if you will, it's a lot of fun, and would like to hear your station.73 Larry AE4LD

Subject: [orion565] W2IHY 8 Band & EQ Plus Settings for Orion II

Does anyone in the forum run the Orion II with the W2IHY 8 Band Equalizer and the EQ Plus. If so, would you share your settings with me. I just installed and I am trying to find a starting point.

Thanks,
Bob

Thanks for these contributions. I will add it to my list of things to do when I open up the big box next time. (I also need to work on the intermittent RIT/XIT decoder issue.)

When I do a serious reset (battery reset?) with v2 firmware and certain shack temperature (cool), the LCD comes up with such low contrast (all white) that I can't easily find the menu contrast adjustment. It's pretty hard to navigate the menu with eyes closed!

Maybe this translation is well known, but I had to puzzle out the following: potmeter == potentiometer

My apologies for the short notation on potentiometer.

Did you adjust the potentiometer to correct contrast level after you had done the release 2 upgrade or is the potentiometer still at the original "release 1 setting" ?

If I downgrade to release 1 I have to adjust the potentiometer again to allow the 50% menu based contrast to work as designed. Without the adjustment the contrast setting is wrong.

Same applies if I upgrade from release 1 to release 2. I have to adjust the contrast potentiometer again... In both cases it is possible to adjust the contrast using the menu contrast setting but the values are at end of scale which could result in the contrast issue you find after a major reset. The default 50% is not providing a good contrast setting.

I would really like to find a way to stabilize the LCD contrast in such way that cold / warm status does not change the contrast setting. Current practice is to adjust the contrast by up to 10% within 30-60 minutes.

The menu based contrast setting is actually generating a PWM signal which gets combined with the -22Volts out of the dc-dc converter. The pulswidth determines the "fine adjustment". I don't see the -22 Volt changing over time as well I don't believe the PWM signal as derived from the processor is unstable. Hence the "combined" signal seems to have components which are drifting and/or the lcd itself is unstable.

Anyway, I will search further and suggestions much appreciated.

Thanks and best regards, Onno pa1ap

5095. Orion 565 and Shure 444

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-22 01:32:37 UTC
From: eduardomontana
Topic: 5095 Message: 5095

Hi and sorry for such a simple topic; i should know this ...
I have an Orion 565, I really like it; it came with a Ten Tec 706 MIC and it works great, but I'd like to use my ancient Shure 444 that has been with me for about 25 years: old habits die hard!

But I cannot figure out how to *correctly* wire it up; while I've managed to wire it up, when I press the PTT I can hear via monitor function on headphones noise which sounds like -I presume- as if coming from the making contact inside the PTT of the mike being in-line with the audio 9i can also very faintly if you pay attention hear the membrane of the MIC faintly click when I key on and off); so the result is horrible when keying on and keying off; I hope I am making sense.

The audio when keyed on is punchy old style ... "just telecommunication grade" the way I'd like to have it.

I've reviewed the page at {http://www.qsl.net/g4wpw/date.html - search for Ten Tec} and the MIC pinout for the Orion 565 is described as follows

PIN1 MIC +
PIN2 MIC -
PIN3 PTT
PIN4 +9 VOLTS.
SHELL/CHASSIS=GROUND

Which I'd assume is correct but the Shure 444 has no + 9 volts ...

Now with current wiring I could use the MIC in VOX position, close locked the PTT and use VOX on the radio to test it out, but I am not a VOX style operator.

BOTTOM LINE: I am trying to appeal to someone that has experience wiring a Shure 444 to this Orion 565 and could tell me how to do it.

I am using the old cable the Shure came with, original wiring ...

Thanks a bunch!

The obvious answer is to insert a thermistor into the circuit, although you would have to do some digging to find one that gave the rate of change you were looking for, and then possibly changing the trimmer potentiometer's value and range so that combined with the thermistor it gave values that were appropriate for the circuit as it stands. Unfortunately I don't think there's a way to "auto-compensate" for the change in firmware, which I imagine changes the PWM duty cycle range per your further information below.

> and/or the lcd itself is unstable.

Liquid crystal itself is very temperature-sensitive, and this temp sensitivity can be seen in any LCD I've ever encountered, from multimeters to digital thermometers and clocks to old handheld video games and so on. I would wager that there is little to no significant effect on contrast in the Orion due to voltage drift caused by capacitor or resistor temperature change, and nearly all of it is from the LCD changing its contrast due to temp, a well-established "given". That said, there are temperature-compensated LCD displays out there that handle this "automatically", presumably with the use of a thermistor.

A quick search brings us to this: http://www.pacificdisplay.com/lcd_cont_adj.htm You will probably find what you are hunting for there. :) Note that from a quick reading of the site it does not look trivial or easy to do unless you have all the engineering specs for the display at hand. That said, the display does appear to be a generic commercial module, so the specs should be find-able without too much trouble assuming you take the front of your Orion far enough apart to find the part numbers or model number(s) for the display unit. Unfortunately I did not think to do this while I had mine apart to fix the optical encoder issue (and the Multi encoder is still over-sensitive, sometimes jumping forward several "ticks" when being rotated just one "tick", and more rarely, being slightly INsensitive to rotation -- doesn't seem like this should be possible if it is using optical encoding and a toothed wheel or something to break the light beam, unless
something has gotten dirty or some debris has gotten inside the actual encoder unit... I

may have to open the thing up at some point and see if there's any loose junk inside).

I'll bet that if you could get the info off of the LCD module, the comany hosting that page could help you sort out temperature compensation. If you got something working, I for one would be willing to pay for a parts kit that also compensated you for your time and effort in finding a useful solution. ;) I'd also be very keen to hear about whether we can also adjust the voltage that controls optimal display angle, as my setup has my radio down rather low and I look down on the display at a fairly steep angle. I can't raise the front of the rig to cut down the angle at all, so it would be kind of nice if there was a way to change that setting, or even to add a trimmer or something so we could adjust it without having to replace components each time.

Well, another "fix" would be to apply a suitable heat pulse to the LCD at
system power on, to bring it to operating temperature rapidly. Details
left to the reader!

I'm relatively certain that most of the heat inside the case comes from the rest of the rig, although some probably comes from the LCD backlight and LCD display driver chips. You would have to somehow blow heated air onto the display itself, evenly so the temp was equalized across the whole display, and keep doing that until the ambient temp inside the case had stabilized plus some time factor to allow for the display to reach its typical temp and stay there. The idea of using a single piece of commercially-available silicon to compensate for the display's temperature is almost certainly an infinitely more practical, cheaper, smaller and less complicated solution.

Unless this was a very late April 1st joke? :)

Greetings,

I have been struggling connecting a mic to the orion 565 for a while. After contact with ten-tec uk I got the following recommendation;

1) Make sure you have a good RF earth,
2) Make sure that RF isn't getting into the radio via the power lead (use a ferite ring?),
3) Check mic lead is in good order.
4) If possible, keep the PTT and mic grounds separate until the connections at the mic plug. Use a good shielded lead.

Most important is that the cable shield really needs to make proper contact with the chassis through the mic plug body. PTT only works when this is the case. Furthermore the mic is considered "balanced or floating". Its recommended that both mic leads (pin 1 and pin 2) remain "floating" and share the same shield to keep it balanced.

The key switch should be seperate from the mic leads at all times. Best to have the switch with both wires terminating at the mic plug instead of using the common shield. On the latter you might want to try to use the shield and have one wire going to the key contact (pin 3) within the mic plug. Keying the rig is done by pin 3 to chassis.

hope this helps, onno pa1ap

Valuable suggestions and when time allows I will do some more fact finding. First I will solder small wires to the potentiometer leads and route them outside the rig. This way I can measure the variation during cold to warm status to confirm change takes place.

The LCD component name is actually included within the schematics but I can't find the manufactor associated with the unit. The backlight is unlikely to heat the lcd screen since its LED based and those don't generate much (if any) heat.

If I may the following variables will have to be explored;

1) LCD stability towards temperature change
2) contrast voltage variation towards temperature change
3) contrast voltage resolution associated with visual contrast adjustment
4) Voltage stability towards the general LCD module

Its long time ago I did electrical engineering and I am taking it step by step while realizing how much i forgot since then :-) One thing I haven't found a clear answer on is the accuracy of the potentiometer. The regulated part towards the LCD contrast pin sees roughly 2K toward -22Volt and 8K towards +5 Volts. This means that the potentiometer picks a voltage out of a range of 27 Volt to arrive at -18 volt (example).... Now given the potentiometer is rated 20% accuracy under normal temperature I wonder what happens with the output voltage when lets say the resistance goes up by 20%...

Here is my (limited) logic;

Essentially there are three resistors in line. +5Volt connected to one fixed resistor (3300 ohm) to potentiometer, which consists of one 8K and one 2K resistor. The 2 K resistor is connected to -22Volt.

+5Volt / 3k3 / 8K + 2K / -22Volt. The plus (+) is the potentiometer variable contact towards the LCD. LCD voltage -17.94 Volt

Suppose the potentiometer varies by 20% due to temperature change (resistance goes up as example)

+5Volt / 3k3 / 9K6 + 2K4 / -22Volt. The plus (+) is the potentiometer variable contact towards the LCD. LCD voltage -17.77 Volt.

The delta is about 170mV which seems to roughly correspond with 10% contrast adjustment within the menu... Coinsidence? perhaps... I need to confirm this value through measurement...

What I don't know is how potentiometers change their value when temperature changes. Would the complete resistance go up or down? Would the smaller value go up/down as much as the bigger value of the variable resistor? In other words, how does a potentiometer behave and what does the 20% accuracy describe?

Best regards, Onno pa1ap

5101. RE: [orion565] Re: Orion 565 (model 1) contrast issue & fix

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-22 17:40:10 UTC
From: John T. Fleming
Topic: 4911 Message: 5101

I have been reading this thread and wonder if there is not a simpler solution? I had trouble with my display not staying the same brightness as well as my S-meter and RIT/XIT. After trying many things, I have concluded that it is all associated with contact oxidation. The S-Meter would not move until I transmitted and from then on, it would work OK. This told me that once there was enough voltage to make the meter go to full scale, the contact was made. The last time I went after the RIT/XIT problem, I not only bent the 2 pins that carry the encoder information away from the LCD display to put a bit more tension on the contacts in the connector but also used contact cleaner. So far it has not failed for 9 months. A check for this problem is to apply pressure to the front between the display and the sweep button. That seems to exercise the connector connection to clean the connection. The connectors are mounted on the encoder board which is attached to the back of the front of the Orion.

When I got frustrated with the display, I drilled a small hole in the case bottom so I could insert a small screw driver and adjust the setting with the menu display setting at 50%. After working on the Orion and putting contact cleaner on all of the connectors behind the front panel, I have not had any trouble with the display nor the S-meter.

I hope this will save some time curing the display problem.

73,
John

Dear Group

I have recently acquired a 565 with V2.062a installed.

Can I safely roll back to 1.372?

I am guessing that is has only been "soft" upgraded to v2 since when I go to select "sweep", it says "V2 mod required for SWEEP"

Yes, that's no problem. You can load any version 1 or version 2
firmware made for the 565.

The new software for the Orion 2 is on the web site to download. It is still the beta version. I have tried the new AF AGC. It sure makes for less noise at night on 40,80, and 160. The AF volume does not seem sufficient for use on 20-10M during the day. The new sweep seems to work better and I like the tuning indicator. Has anyone written up about when is the best time to use the AF agc? Seems like you need to run the AGC slow also using AF AGC.

How long does the upgrade(downgrade) take to complete?

It has been running for an hour and has completed 300 out of 9446 lines. I
will leave it running overnight but must use the PC in the morning for work
so would have to crash the program.

It should only take a couple of minutes. Sounds like you have a serial
communication problem. If you're using a USB>serial adapter you may
need to find a different one to try. It's best if you can use real
serial port.

5107. 566 Multi Encoder Problem.

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-23 02:10:52 UTC
From: Yuri VE3XB
Topic: 5102 Message: 5107

Hi,

Does anybody know what is the part number for Multi encoder for 566 model and where I could buy one?
Schematics show it as a S64 but no mention of the type. It just stopped working - no matter how much I turn this knob the numbers stay the same.
Is it worth trying to repair encoder?

Thanks in advance,

Yuri VE3XB

Tnx Alan

How long does the upgrade(downgrade) take to complete?

It has been running for an hour and has completed 300 out of 9446 lines. I will leave it running overnight but must use the PC in the morning for work so would have to crash the program.

5109. Main recvr will not completely mute via internal speaker

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-23 08:36:41 UTC
From: Rob Thomson
Topic: 5109 Message: 5109

I can still hear (low) audio from the main rx in the on-board speaker despite the mute button being pressed (and the audio scale shows in the half bar state).

If I mute both main and sub rx and change the speaker output between the 2, sub rx gives no audio but main is still detectable.

If I plug in headphones, both receivers are fully muted. Likewise, with an external speaker, both rx audios are completely muted.

So - in summary, it is ONLY main RX and ONLY through the internal speaker.

Regards
Rob, G4LMW

You may want to clean the pins for the board connectors and put some dielectric grease (with anti-oxidizers is\f you can find it, or maybe DeoxIT products) into the female connectors. There is a known issue with oxidized or otherwise not solid, reliable DC contact on the pins in these connectors, so I'd start there first. I'd also check to make sure I didn't have a cold solder joint or a broken trace on a circuit board before I started replacing components.

You are in a bizarre position now... I think it is related to your earlier problems of firmware update issues.

If the Rx/audio was working o.k. before (running V2x) and you have had problems flashing back to V1, you have got to get the programming sorted out before assuming there are audio or rx problems.

Try to re-flash it.
Try another computer.

Almost everything in the radio (including audio stage) is controlled from the programming so it has got to be loaded correctly.

Once loaded successfully, then suspect the audio stages and receiver.

Personally I used to recommend V173b5 but there have been so many "fuzzy" issues relating that I would now only suggest V2x, whichever version on 2x is up to you. We have pursued so many apparent hardware faults on the bench which cleared with V2x firmware!

Richard

Thank you for taking the time to reply.

All understood. This radio has not been hardware modified for V2 and I wanted to use the "sweep" functionality, hence rolling back to v1.

I was also led to believe (???) that the overall receiver performance was better in v1 ?

The "un-muted" audio is not a big problem for now, so I think that I will gain some experience of the radio using V1.x first, then (if as you suggest, V2 is indeed an improvement) think about getting the toolkit out! ......

From: Rob - G4LMW
Topic: 5102 Message: 5113

Thanks for all the responses on this (on and off-list).

The problem was solved by digging into the folder in which the upgrade program was installed and stumbling across the "how to" text file. There is no mention of this file in the program instructions, the manual or the website. There is also no mention of "Flash Update Mode" in an other documentation.

Needless to say, once I put the radio into update mode, the process took a few minutes to complete. I guess the Orion objects to being "flashed" while still trying to process signals!

This file is extracted to the TT folder during install, as you say the
text could have duplicated elsewhere.

I have looked at the Orion 565 operating manual "25 April 2003 3rd
printing", the details are clearly written on page 3-17 with a shaded
box saying "FLASH UPDATE MODE".

It is mentioned in section 4 of the Orion-II 566 handbook (starting on
page 49) but the heading is not obvious as it refers to reset and
internet updating.

Also you MUST do a full reset when changing from V2 to V1 etc as
mentioned on the TT download page and in several places.

You have it working now, so all is well.

It is a while since I ran an unmodified Orion 565 with V2 firmware... I
thought the sweep worked (ignoring the message) but not at enhanced
speed. The mod is not too difficult and is documented in the TT
download section.

>I was also led to believe (???) that the overall receiver performance was
>better in v1 ?

There are many issues with V1 which are not there on V2. Some people
prefer the notch implementation of V1 in respect of AGC when compared to
V2 but the Orion-II 566 uses the V2 method too and TT feel they have
good reason for doing it that way. Having seen V1 units on the bench
with faults cleared by simply loading V1 firmware (no repair necessary)
has lead me to feel that V2 is the best and most stable version.

Did you do a full rest after loading V1 ??

Thanks again Richard (off list)

I think that I was just born unlucky.

The manual supplied with my Orion is dated "Revision 3 - February 2005".

I have had another look and still cannot find any reference to "FLASH UPDATE MODE". I'm going to have one more look (for curiosity sake.....)

Perhaps I need to source another manual?

5118. Orion 1 power switch

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-23 14:10:06 UTC
From: ko4xj
Topic: 5118 Message: 5118

1. Has anyone had issues with the power switch? I have a intermitting issue where the rig does not power down when I flip the power switch. The first time it happened I turned the power supply off then back on and then the switch worked. Later it happened again and I had some other unrelated issues and I did a BATTERY RESET and then the switch worked. That made think could it be a software issue. Last two days it's happened several more times but is stable this morning

Is there any software control lines that can effect the switch or is this a switch getting ready to go out?

Thanks
73

John

Hi Adam,

Thanks a lot for your advice.

I took the radio apart and "refreshed" all suspicious solder joints on the encoder board. After about an hour of sweating and swearing managed to put everything back together and there you go - Orion is back in business.

Appreciate your help.

Glad it worked out that well for you!

Considering how much the board gets flexed during normal use, I'm not too surprised that we are starting to see some solder joints failing in some of our radios. I noticed a distinct improvement with cleaning and protecting the pins on the inter-board connectors with anti-oxidant laced dielectric grease, but didn't check the solder joints before reassembling. :D Hindsight and all that. The radio has to come back apart again to finish the buffer amp install for my shiny new SoftRock Lite II -- I'm very much looking forward to coming back with reports about how much the radio's capabilities have expanded by melding the Orion with an SDR receiver back end, which interact via software (PowerSDR has been modified for the SoftRock Lite IF version and can interact directly with HRD, allowing, as a for instance, you to click on a signal on your PowerSDR waterfall and have the software tune one of the Orion's VFOs right to that frequency)... I can't wait. :D I probably won't even mind re-soldering joints on the encoder board while so looking forward to first running PowerSDR and seeing signals on the waterfall coming from the Orion's first IF... :D

John,

According to my schematics, the power switch controls bias on a transistor (A0 Q23) that drives relay A0 K1 that switches most of the current. Your K1 could be sticky, or possibly your power switch, but there's no software involved.

This isn't a fix, however I wouldn't know if my O2 has a bad switch or not as it's never been turned off since I got it about 8 months ago. I'm a firm believer that electronics last much longer when left on (except my Alpha 91b amp, too expensive to keep running). My luck, if I turned it off now it wouldn't come back on, hihi.

Thanks Martin..

I was going to call TT today and see what issues they would report on with this issue and see about a switch BUT got busy and forgot. so far (knocking on wood) it has not acted up since I sent the request out..isn't that the way it always go!! I'll give them a call Monday

Thanks for the reply

John,

According to my schematics, the power switch controls bias on a transistor (A0 Q23) that drives relay A0 K1 that switches most of the current. Your K1 could be sticky, or possibly your power switch, but there's no software involved.

What about electrolytic capacitors with an average lifetime expectation of 2000 Hours when used at max temperature? There are many of them within the unit and especially the ones which are used for charge pumps etc. are very vulnerable because of the high frequency of charge and discharge.

5125. questions about 2.041XL firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2009-04-27 11:09:52 UTC
From: k0xb3
Topic: 5125 Message: 5125

Now that the new firmware has been out for several months, I'd like to ask for your impressions about it compared to 2.039d. In particular, are there real benefits to the new option to use AF AGC?
Thanks, Rick K0XB

Topic: 5128 Message: 5128

I can't seem to find any info in the manual about a small letter "C" right above the 100Hz digit and just left of "TR". I don't remember seeing this before nothing I do seems to remove the letter from the display. Sorry for the dum question one of these days I'll figure this rig out.

Not dumb Dave - just not documented! It indicates which of the four band stacking memories is in use for the selected frequency. Select a frequency - say 80m - press the 80m button repeatedly and you will cycle through A, B, C, D - each memory can hold a different set of settings. Hope that helps

Well it's documented but not well enough! Page 23 on the manual under (57) Frequency Entry and Band Change Buttons, the third paragraph describes the band stacking but does not explain it

Personally, I've seen electrolytic's rated at 2000 hours go bad after 1000 hours of on/off usage when the same have lasted, well they are still in use after 5 years (43,800 hours) of continuous duty. I guess it's just a matter taste.

Orion consumes ~50W (3.6A at 13.8V) in standby, so you'll consume 438 kWh per year which is about $50 annually at current rates. If you leave other stuff on continuously (like computers, printers, TV, etc), you're paying a lot for a very questionable benefit IMHO.

Hi guys, i am relatively new to the group. I have been watching for sometime but because i run a company aswell i have found it hard to follow all the correspondence. Its a very active group which is a very good thing. I apologize now if what i will ask in future will cross over with things already discussed. Bear with me, i have a few questions about this lovely piece of gear i have owned for 6 months.

First question: Looking on start up i have a May 2007 version, 2.04b7 or something.

What is the latest update and what will it give me or improve? This might be aiot so just bullet point them or maybe a link i can read up on please.

Anything to watch out for on the updates? Any help is much appreciated.

regards,

Dean ZL1COB

Dean,
I can handle your first question - your 565 is already at the latest level of software. We're all holding our breath waiting for the next version to release, hopefully soon. I'll ask Scott at Dayton to see if they're bold enough to project a date for that.

Enjoy the radio - I sure like mine!

From: Dean Cobussen
Topic: 5141 Message: 5143

Thanks Duane. Thats a good start.

Second question: I am a bit confused with the use os the DSP tappings. I know what it does and why but i seem to have DSP "crackle" on high settings. I get less of this when i use the lowest setting, 32 taps. It seems to be related heavily to amount of general power noise i am getting on 40m at the moment since am in the city and need to use the NR at 9 alot.

Does anyone have any experience with this?

I often hear hash when altering the setting. A slight movement of the knob and it quietens.

What settings seems to be optimal for other users?

I experienced none of this with the FT2000 i had previously and while its not a great comparison, i find the Orion hard on the ears at times.

regards,

Dean ZL1COB

Dean,
From what I know about the way the dsp works is that the higher number means the signal is looped back through the chain more times. So, I would think that's why you're noticing the effect you've described. You never mentioned if you were using the hardware noise blanker at the same time. I have noticed that it will take out most power line type noises, but that very strong signals will have a mushy sound to them like most analog noise blanker circuits do produce by their very nature.

Greetings,

If you are using orion 565 it might be worthwhile to downgrade the unit to 2.056, perform memory and master reset.

I found despite the so called AGC enhancements for later versions, this version offers clean operations and comfortable listening to stations while static is in the air.

All versions post 2.056 have significant issues with strong signals and static noise all resulting in distorted audio.

I have posted a document on this audio distortion within the file section. Check the folder pa1ap agc stuff for details.

Like many others, I am really looking forward to the new release of firmware.

My two cents.

Thanks Onno, that explains a few things. This is all good, i am enjoying everyones 2 cents! Thank you.

Now for my third question - i only just noticed this when shifting rooms and no antenna plugged in:

I think the front end is taking off or something. I see a S2 reading on the meter with nothing in and a dummy load on the ant socket. I have a 2.4Khz filter in, no RF amp and no noise reduction either.. the meter moves, jumps slightly above S2. I also tried adding in and removing filters which does alter it a bit. A 1Khz drops this about 1/2 an S point as does the 1.8Khz filter. I noticed with no filter at all (my 250hz setting as i do not have one) it drops again. When i keep it on this 'no filter' setting and use the BW knob to narrow up the audio to 150hz on LCW, it drops right down to zero.

Its as if my RF front end has either too much gain or is taking off. I have not touched the insides and i know nothing of the settings. Any ideas?

I am yet to look for any type if servicing information on this as apparently there is no service manual, so i am told.

Correct. In your initial post, you mentioned a firmware version as
2.04b7 which sounded to me like an Orion 2 rather than an Orion.

If you were experiencing DSP "crackle" with a 565 Orion running v2
firmware, I would encourage you to load v 1.372 or 1.373b5 and try
that instead.

Greetings,

On attenuation I am finding the same result as you have found. Tuning the bandwidth down makes the s-meter drop down as well. It actually goes in steps and this is caused by the 8 bit DAC which drives the s-meter.

Smaller bandwidth x-tal filters do cause more attenuation and when I am crossing the x-filter boundaries the s-meter drops down indeed.

On 400 and 250Hz there is an additional if stage to compensate for the additional filter loss caused by such small bandwidth filter and this is indeed reflected in the s-meter. In my case it actually jumps up a little when switching from 1Khz to 400Hz to drop down again (to zero) when moving into the 250hz filter. I am using inrad filters and the 250hz filter has more attenuation then the 400hz filter.

According the inrad website: 1000hz -4dB / 400hz -9dB / 250hz -13dB. So it seems the additional if stage on 400 & 250hz position is a little above 9dB and certainly less then 13dB gain :-)

Now you are investigating the whole if chain anyway and when time allows on your side, perhaps below some more interesting thoughts for the mind.

Are you running AGC prog or AGC slow/medium/fast setting?

When running release 2 code the s-meter is "connected" to the AGC threshold and RFGAIN setting.

When no antenna is connected and threshold is set to minimum and RFGAIN is set to 100 my s-meter reflects about S1.

When I move threshold (or RFGAIN) to a higher value the s-meter follows the setting by increasing the s-meter value. This is supposed to help you finding the correct threshold value.

As example; I am listening on 80 Meters right now and my band noise is around S5 (in fact is is changing between S4 and S6 the whole time due to atmospheric conditions). When using default threshold value (1uV) the noise is sometimes clipping due to expected AGC action. I can make the receiver much more comfortable by increasing threshold to the noise level or just above. In this particular case around 6uV does the job for me.

An S2 indication driven by threshold would be around 00.89uV in the menu but please consider the s-meter resolution 8 bit only (due to 8 bit ADC).

There are two ways to avoid AGC kicking in. Threshold and RF GAIN. RF Gain makes large steps (2dB steps) and Threshold allows you to take smaller steps especially in the low signal region. At the end the threshold value moves the activation level of AGC upwards (bottom up) and any signal below threshold is kept original.

I am always using the threshold value and I really like it. It allows me to define the AGC activation point based on band conditions without loosing sensitivity due to mixed signal AGC compression.

From what I understand on the AGC settings (i might be wrong here);

The magic signal popping out of the noise myth, remains a myth to me but adjusting the threshold carefully does allow you to differentiate band noise from weak signal and hence you can pick out the weak signal a little easier.

Band noise is often bursty (sorry for simplified English here) in nature and as a result it might activate / deactivate the AGC very fast. When your weak signal is just a little above the band noise and you would use the default AGC settings the weak signal detection might follow the gain as dictated by the band noise instead of the weak signal itself. Hence the weak signal might get compressed together with the band noise. As a result the weak signal "disappears" in the noise. It certainly pays to consider using the threshold value in my humble opinion.

But at the end, when weak signal really drops below band noise nothing within the AGC settings will allow you to pick out the weak signal.

Thanks Onno. Ok on the filters etc... this rings true then. I did my recent tests this morning on the Slow setting. With regards to Threshold, i have played with this also and found similar things. I will do more of this tonight to understand more of what i am seeing.

Regarding your statement below:

> When no antenna is connected and threshold is set to minimum and
> RFGAIN is set to 100 my s-meter reflects about S1.

I assume a typical filter in place like 2.4Khz? Do you see the meter dance a bit or jump around at all? I find this odd.

No dancing s-meter (un)fortunately :-) I have tried at all filter settings and besides the known s-meter jumps when passing a filter boundary nothing changes. I have all filters installed.

The s-meter is driven by a 8 bit DAC and the processor calculating the real s-meter value could drive the DAC much faster then the s-meter can handle.

It would be logical to assume the processor would combine a certain hang time and sampling rate to avoid a very nervous s-meter. Obviously this would translate itself into what seems an s-meter making weird jumps under certain conditions.

Which firmware are you running now? If you are reading through the firmware release notes you will find that certain firmware versions have issues with noise bursts when you turn certain encoders and such like. Those bursts might move the s-meter but i haven't tested that.

hope this helps,

Onno pa1ap

Dean,

My S-meter does the same. To stop it turn Sweep OFF.

Regarding your statement below:

> When no antenna is connected and threshold is set to minimum and
> RFGAIN is set to 100 my s-meter reflects about S1.

I assume a typical filter in place like 2.4Khz? Do you see the meter
dance a bit or jump around at all? I find this odd.

Thanks Yuri, i thought you may have been onto something there! It did not work. I am surprised if it did for you. However, i am still running 2.062a and struggling to find the 2.056 version firmware.

The HW noise blanker does drop the S meter reading to 1.5 on the S meter and stops the jumping. Its clearly internal interference of some sort.

5159. Distorted sound from "Line-Out" (O2)

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-05 08:12:34 UTC
From: Peter Frenning [OZ1PIF]
Topic: 5159 Message: 5159

While working to set up a sound recording routine, I noticed that the audio from the Line-Out pin (AUX I/O connector) is severely distorted regardless of volume setting (Low/Med/High).
Using the exact same set up, but connected to the "Data" jack on my FT-847 the recorded audio is fine (Even though it's even higher volume than the "High" setting on the Orion).
Taking the AF from the radio into a SignaLink USB, and into Ubuntu 8.10 running Audacity. I've tried another USB "Soundcard" with the exact same result.

Has anybody else noticed this? or even found a cure?
And oh, BTW: Running 2.041XL Beta FW!

You can find most firmware on the tentec wiki page.

http://www.tentecwiki.org/doku.php?id=orionfw

I found suprising results with the noise reduction feature when comparing 1.372 and 2.56. I will upload them a little later.

Best regards, Onno pa1ap

Greetings Dean

Below my log on the release 2 versions related to AGC function. Agreed they might be subjective but it might help;

FW DSP Comments
2052 201b25 excellent, no agc distortion
2055 201b26 excellent, no agc distortion
2056 201b26 excellent, no agc distortion
2057 202b3 agc spike distortion, master reset: no effect, mem reset: some effect but not enough
2060b 204b4 little better but still some distortion
2061f 204b7 little better but still agc spikes
2062a 205b7 agc spike distrotion, master reset: no effect, mem reset: no effect
2056 201b26 change back to see difference; again excellent and no agc distortion.... seems dsp code & agc has been broken after 2056

right now i am using 2056 and take the "bugs" for granted. You can check the files / pa1ap agc stuff for the pdf document which shows the agc distortion.

I have downgraded yesterday to see how noise reducation was working and it seems to work better then release 2. However somehow release 1.372 is a little more uncomfortable to listening too, the sound seems a bit hollow to my ears. I will upload some audio pictures which show the difference.

I recommend to up/downgrade to a version and use it for a couple of days / weeks to get used to its behavior. Then change the firmware (dont forget to do memory reset and master reset) and repeat the cycle.

Hope this helps, Onno

Problem found: There's a 5V! DC component on the "Line-Out" pin!!!!!
a 100nF in series with it solved the problem!

5163. Orion 565 firmware comparison

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-05 14:15:04 UTC
From: pa1ap
Topic: 5163 Message: 5163

Greetings,

When time allows I am comparing the two main firmwares and this time I captured the noise reduction. I was struck by the difference and made a capture of the audio log. I have uploaded a pdf document to the files section:

http://groups.yahoo.com/group/orion565/files/pa1ap%20fw%20comparison/

Perhaps this is interesting to see and i would like to see how the orion 2 performs on this.

best regards, Onno pa1ap

5164. Will2.041XL ever be anything but a beta?

What could possibly be taking so long to tweak the beta software to a permanent release? Could there have been that many bugs? Was the Xl release just a tease?

Brad

I doubt it is/was "just a tease" ... and what minor items
I have noted, I have reported to Ten-Tec for their review
and some new thoughts for additional features/improvements.

... so how about you Brad, have you done the same?

Perhaps they are waiting until someone finds a major concern
or are working on some of the improvements already requested.

With Dayton next week, I am certain many will be asking there.

Terry, I just saw your ad wanting to buy an Orion II. I have one purchased in 2/07 that is in perfect condition. Did you buy one yet? Mine was bought new for $4,295 and am asking $3,000. Manual, DVD & original box & packing materials are available for shipping. My husband loved it, but he recently died, and I would like to find a new home for it. I'm asking what TenTec would pay for it, but they would mark it up from there. Please email me at ned1@... if you are interested or know of anyone who is interested. thank you, Susan (wife of WO7A)

Want to buy Orion II. All offers graciously considered. If you are considering selling yours, please consider contacting me @ 214-298-2768, or email tlp1@vzavenue. net. I'm hoping anyone that considers contacting me about selling theirs wouldn't mind emailing me some clear pictures, and mind telling me a little about the radio, such as 1st, 2nd, 3rd...ownership, how old it is etc. I'm not in the radio resale business, just an individual looking for a fair deal on an Orion II. I prefer to pay with pay pal, but will consider other methods of payment to meet sellers requirements. Please consider contacting me if you have one to sell.

Many thanks to the group owner for letting me post this and all who take time to read it.

All the best,

Terry-W3QJ

Terry, I just saw your ad wanting to buy an Orion II. I have one purchased in 2/07 that is in perfect condition. Did you buy one yet? Mine was bought new for $4,295 and am asking $3,000. Manual, DVD & original box & packing materials are available for shipping. My husband loved it, but he recently died, and I would like to find a new home for it. I'm asking what TenTec would pay for it, but they would mark it up from there. Please email me at ned1@jeffnet. org if you are interested or know of anyone who is interested. thank you, Susan (wife of WO7A)

Want to buy Orion II. All offers graciously considered. If you are considering selling yours, please consider contacting me @ 214-298-2768, or email tlp1@vzavenue. net. I'm hoping anyone that considers contacting me about selling theirs wouldn't mind emailing me some clear pictures, and mind telling me a little about the radio, such as 1st, 2nd, 3rd...ownership, how old it is etc. I'm not in the radio resale business, just an individual looking for a fair deal on an Orion II. I prefer to pay with pay pal, but will consider other methods of payment to meet sellers requirements. Please consider contacting me if you have one to sell.

Many thanks to the group owner for letting me post this and all who take time to read it.

All the best,

Terry-W3QJ

I bet you're right but if the previous answers from Dayton's past are representative of the full population I bet we won't see the beta fixed for a while.

Onno, what a difference!! I am running 2.056 and i am amazed. I always felt the RCVR was harsh/noisy. Its a huge difference for my ears - the AGC performance is much better. Now the NR actually works properly! Previously the NR was very acute and hollow. I notice a delay in flicking through the VFO stack now and some other little quirks i can live with. I can not believe they released 2.062a to fix simple things and ruin the performance, its quite significant. The files you uploaded tell the story alright.

Thanks for all your input and help mate!

Dean ZL1COB

PS: meter still not right, no change in this area

Thanks PETER! Great finding and good information on the 5Volt DC on the line output.

Confirmed that the Orion 565 has the same issue. The additional capacitor fixes the issue.

Thanks Peter!!!!!

Glad this helped Dean. I found the members in this forum very responsive and its great we share idea's and findings.

On the firmware I personally prefer Ten-Tec releasing firmware as Beta rather then waiting until it might be perfect.

There is sense in what they modified after 2056 (read the release notes and you will see) but unfortunately it had negative impact on other area's.

I would suggest you keep this running for a week or so, get used to what you hear and then downgrade to 1.372 as Barry (N1EU) recommended. This way you can really compare the two and decide which one you prefer until Ten-tec releases the new firmware.

My best practise use of 2056 is to turn the VFO to an empty spot on the band and turn up the threshold until the s-meter "freezes" the band noise. Then you might decide to go back one step or not. This way you have best dynamic range and the band noise becomes stable and silent. I have set Decay somewhere between 10-20dB depending on mode of operation. For casual ssb conversion you can smooth the audio response a little more by introducing a hang-time of 0.08 second or so.

What you will find when using 2056 is that sound is clean and overal it works just fine. Spectrum display is shifted a few 100 Hz (who cares), bandstack is questionable but overall responses are good for all other functions. 2056 AGC will give you issues when there is static discharge causing very quick spikes on the band. Then 2056 seems to slow to recover from that and today you would need to increase the decay to higher value to compensate for this. This specific case they have tried to fix in later versions and it made the AGC very aggresive which you can see in the audio pictures.

I have documented & visualized the effect of threshold, decay and rf gain towards signal processing and will complete & upload this when time allows.

Enjoy the rig, its a great device.

Best regards,
Onno pa1ap

From: pa1ap
Topic: 5141 Message: 5178

perhaps you know already, but below an easy trick for operating ssb;

If you are operating ssb then the VFO dial speed might be a bit annoying since it seems to take forever to get to the right frequency. I have done the following and it works great for me;

1) set the encoder speed to fast instead of slow (default)
2) set the step size to 10Hz
3) push the VFO A (or B) button and you will see the step size as X100hZ
4) with this mode i am dialing over the band quickly but slowly enough to figure out where stations are
5) when finetuning is required I push the VFO button again and it switches back to 10Hz... This is accurate enough for ssb operation.

Since the VFO button is next to the big VFO dial it is easy to get used to this operational model.

Best regards,
Onno pa1ap

5179. Re: VFO Tuning Rates

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-07 17:05:23 UTC
From: pa1ap
Topic: 5174 Message: 5179

Please consider the encoder resolution is limited to 62 or 250 steps...

This compared with other rigs using anywhere between 1000 and 2000 steps you might run into a suprise when dialing over the band using large steps.

Also the VFO does not apply fuzzy/adapting algorithms to learn the speed of rotation and translate this into incremental step size as is the case for most if not all japanees rigs. Fuzzy/adapting algorithms only make sense when the dial has sufficient resolution (in other words >1000 steps) to adapt the step size quick enough.

It would be great to have a 1000 step/rotation encoder and implement a speed adaptive step size to allow smooth bandtuning..

What do you need this large step size for? Very curious to learn the application!

Best regards,
Onno pa1ap

Dan, thanks for the info. I am seriously thinking of buying a new orion II but I read a RSGB review and got confused when they stated the tuning rate was not fast enough for SSB.

Let me make this real simple so I dont get confused.

My XYL has a rig that when turn the VFO and say you are on 3.825.00, one complete turn of the VFO will go to 3.827.00, which is 2k..To slow for me...

On my present rig one turn of the VFO is 5k or going from 3.825.00 to 3.830.00.....

So if as you say the steps are from 1 to 100k and 5k is in there then that is fine...

Thanks, Sonny....AB4VV

Thanks for taking the time to reply to my post but I dont understand what you are saying....

When you say 'steps' are you saying 1hz = a step?

To keep it simple say I am on 3.820.00 and I turn the VFO to the right, and if I go one complete turn of the VFO what would my freq. readout be ?

Sonny...AB4VV.....

5182. Re: [orion565] Re: VFO Tuning Rates

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-07 21:52:53 UTC
From: Alan Sewell N5NA
Topic: 5174 Message: 5182

The step rate is not per revolution. With the step set at 1 Hz, if you are on 3.820.000 and you turn the VFO to the right one step it reads 3.820.001. If it's set to 10 hz and you turn one step it reads 3.820.010. Set to 100 hz it reads 3.820.100. etc.

In the menu there is a setting for VFO A & B Encoder Rate. You can set it to Fast or Slow. With it set to fast and a 10 Hz step one revolution changes from 3.820.000 to 3.822.470 (approx. - hard to judge exactly one revolution). When set to Slow one revolution changes from 3.820.000 to 3.820.600.

Hope that helps.

Sonny, here is some plain language - the rates of VFO tuning 1, 10, 100, 1Khz, 5Khz etc are minimum VFO steps or increments. If your on 100 (100hz) like i am often when shooting up and down the band, the read out displays in 0.1Khz jumps as i turn the dial. Its about 6-7Khz per turn for this setting and i find this fast enough for screaming up parts of the band on the Orion. However, i use VFO stacked presets spread over the band for faster jumping so i do not need to change this step setting often. 4 per band... so on 20m, i have the first one set for 14.070 - PSK for example and it stays on that. I can then push the band button and cycle through them easily in order. Same for reach band.

The Orion also has a nice finger dial on the VFO unlike some other rigs so this makes it easy. Trust me, there are more than enough step settings for you to do what you want, fast or slow... you will never use them all.

Sonny,

If it helps, I've owned everything from the Best Icom (at the time) to Kenwoods to Yaesu, and the older Heath and Drake units.

Ten Tec is probably the best unit (electronically) that I've owned with far superior electronics than all of the above. The ONLY thing that I do not like about my Orion II is the 6 knobs to the right of the display (and controls behind those knobs). The have the look and feel of some inexpensive Radio Shack product. The VFO's are fine, the push buttons are ok, but those six knobs are "cheap". (If you have ever owned an Icom 756pro you will know the feeling of a MilSpec control!)

It's ruff 'n tuff and can pull the weak signals in. I'm primarily on SSB using my W2IHY audio products (EQ 8 bander & EQPlus) and get excellent audio and signal reports. My Ten Tec drives an Alpha 91b Legal Limit amp, with 39 watts from the Ten Tec providing 1500w output from the Alpha. I also use the Palstar AT-AUTO Legal Limit antenna tuner and an Ameritron Remote Coax Switch RCS-10. My GoldLine microphone was built by Bob Heil. As you can see, my station is almost 100% American made.

Plus, T*T has their 30 day return policy if you don't like it.

Good luck with your decision !

73,
Sam
K3SAM
Butler, Pa.

PS: The security system that guards all of the above is also American made, hihi.

Subject: [orion565] Re: VFO Tuning Rates

Dan, thanks for the info. I am seriously thinking of buying a new orion II but I read a RSGB review and got confused when they stated the tuning rate was not fast enough for SSB.

Let me make this real simple so I dont get confused.

My XYL has a rig that when turn the VFO and say you are on 3.825.00, one complete turn of the VFO will go to 3.827.00, which is 2k..To slow for me...

On my present rig one turn of the VFO is 5k or going from 3.825.00 to 3.830.00.... .

So if as you say the steps are from 1 to 100k and 5k is in there then that is fine...

Thanks, Sonny....AB4VV

Terry, I just saw your ad wanting to buy an Orion II. I have one purchased in 2/07 that is in perfect condition. Did you buy one yet? Mine was bought new for $4,295 and am asking $3,000. Manual, DVD & original box & packing materials are available for shipping. My husband loved it, but he recently died, and I would like to find a new home for it. I'm asking what TenTec would pay for it, but they would mark it up from there. Please email me at ned1@jeffnet. <mailto:ned1%40jeffnet.org> org if you are interested or know of anyone who is interested. thank you, Susan (wife of WO7A)

Want to buy Orion II. All offers graciously considered. If you are considering selling yours, please consider contacting me @ 214-298-2768, or email tlp1@vzavenue. net. I'm hoping anyone that considers contacting me about selling theirs wouldn't mind emailing me some clear pictures, and mind telling me a little about the radio, such as 1st, 2nd, 3rd...ownership, how old it is etc. I'm not in the radio resale business, just an individual looking for a fair deal on an Orion II. I prefer to pay with pay pal, but will consider other methods of payment to meet sellers requirements. Please consider contacting me if you have one to sell.

Many thanks to the group owner for letting me post this and all who take time to read it.

All the best,

Terry-W3QJ

Yes, thank you I understand.

I did contact Susan by email, and explained I had already found one. I believe that is a very fair price ($3,000) if the radio has the optional AT, and the optional roofing filters installed. I have recently seen others selling the 566 non-AT without the optional filters asking $3,500-$3700.00 used. Both radios were on ebay, and the auctions ended with no sale I believe. I hear some of these same people complain about folks selling used ham equipment at inordinately high prices, yet when they put their gear up for sale, they want top dollar (of course). Double standard.

However, I believe Mrs.. Landis is asking a very fair price for the Orion II. If I hadn't found one already, I would buy it. Hopefully those hams close to her and her late husband will list it on some of the on air swap nets.

My sincerest condolences to Mrs.. Landis.

Yeah, but that's the change per DETENT, not per REVOLUTION. In the 100k setting (that's changing the frequency in 100k STEPS), I can cover 10m top to bottom in one quarter of a revolution of the VFO dial.

I just set my step rate to 100k, hit the Main RX button again to add the multiplier. Now I go from 3.50 to 4.0 from 12 o'clock to just past 1 o'clock.

That should be plenty fast.

Wow. My answer on May 7 stated:

"In the menu there is a setting for VFO A & B Encoder Rate. You can set it to Fast or Slow. With it set to fast and a 10 Hz step one revolution changes from 3.820.000 to 3.822.470 (approx. - hard to judge exactly one revolution). When set to Slow one revolution changes from 3.820.000 to 3.820.600."

http://groups.yahoo.com/group/orion565/message/5182

Don't know how you can get much clearer than that. There is not a simple button press that sets the tuning to 1 kc/rev, 5 kc/rev, 100 kc/rev etc. There are several settings that affect the kc/rev.

5194. RE: [orion565] Good Bye To The Group.... I Give Up !!!

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-08 15:44:04 UTC
From: Dan McKinley
Topic: 5192 Message: 5194

Ok.

14.300 with a step of 1 moved one complete revolution go's to APPROXIMATELY 14.300.070 =70hz per rotation

I run it on 100hz most of the time and all is good. 14.300 on 100 hz with 1 revolution gives me approx: 14.306.700= 6.7kc per revolution

If I set it to 14.300 and the step to 100k, then it will top out the receiver at 15.000 by just turning the knob approximately half way.

Now how fast do you want to turn the knob?

Isn't that fast enough?

Anyway have a nice day.

Dan

From: orion565@yahoogroups.com [mailto:orion565@yahoogroups.com] On Behalf Of nmbsun1
Sent: Friday, May 08, 2009 10:21 AM
To: orion565@yahoogroups.com
Subject: [orion565] Good Bye To The Group.... I Give Up !!!

My original question went something like this:

"What is the tuning rate of the VFO of the Orion II. That is, one complete revolution of the VFO. Even to make this easier to understand, I gave an example i.e. "If my readout is 3.820 and I turn the VFO to the right one complete revolution what would my readout be?" How much simpler can it get to answer my question? I got everything BUT the answer.

Thinking that perhaps I did not word it right I asked everyone of my ham friends on my email list the same question and received plain and simple to the point answers. Like from one I got "I can set this rig to 3 settings. 1st is 1kc per revolution, then 5kc per revolution, then 100kc per revolution"......

Could someone explain why no one can answer a simple question about the Orion II ? Or is the Orion II so complicated that no one can figure it out ?????

73, and good bye AB4VV.....

Sonny

Don't be too hasty. I think that the question kept just going astray......

I have an Orion I but as far as I know the 2 are the same in respect of tuning capabilities.

In a nutshell, you get (approx) 65 "steps" per revolution (at least, I did when I tried it!).

i.e. on the 1Hz step setting, one VFO dial revolution = 65Hz

1Hz = 65Hz per turn
10Hz = 650Hz per turn
100Hz = 6.5kHz per turn
1kHz = 65 kHz per turn
5kHz = 325kHz per turn
10kHz = 650kHz per turn
100kHz = 6.5MHz per turn (not sure why you would want this setting!)

Hope you will stay

Alan,

I do apologize to you as I did go back and read what you said. As far as I can tell you are the only one to answer the question. I did reply to your answer but it never showed up here as I stated something to the effect that "with a tuning rate that slow I would not like it for SSB, even the RSGB review stated the tuning rate was too slow for SSB" Perhaps the owners of this group did not like my response!

I should have added that the findings below are for the "slow" VFO encoder rate.

For the fast encoder rate, multiply by a factor of (approx) 4.

Sonny - I should add that if you wanted a simple answer, you have chosen the wrong radio. It effectively has 14 step choices, so the simple answer is hard to give!

However, I would find it difficult to believe that you cannot find a tuning rate that would satisfy your needs!

Everyone has their preferences but I don't know why the RSGB review stated the tuning rate was too slow for SSB. I keep mine set to 10 Hz steps with the encoder set to slow for CW, SSB, & RTTY. It's never been a problem and I've had my Orion since May, 2003.

I'm a member of the tentec@... reflector, the Ten-Tec Yahoo Group, and this group and I don't recall anyone ever complaining about the tuning rate or even this much discussion about it. As someone has already stated, there are so many choices you can set it would be hard to believe you can't find something you like.

When the price of the ten tec orion II is 4,600 I want to know all I can about it before I lay down my hard earned money. If you feel my questions are petty and childish then why dont you just buy me an orion II and I will quit asking questions and just be your 'yes' man! LOL

Listen, seriously when I read what Peter Hart, G3SJX wrote in the review of the ten tec orion II I wanted to know what he was talking about. He stated,

"My biggest disappointment concerns the
VFO tuning knob resolution. These are nice
and large and can tune in a variety of step
sizes from 1Hz to 100kHz but at only 62
(default) or 250 steps per knob revolution.
This may be fine for tuning the CW ends of
the lower bands but is not ideal for the
wider SSB sectors on the higher bands.
Even 20 years ago, 1000 steps per knob
revolution was the norm in top end radios
and this degree of resolution has been used
since then in the most popular models. It
gives a good compromise between small
step size for accurate tuning and fast band
navigation. With the Orion, it is necessary
to switch back and forth between step
sizes when tuning across the SSB sectors.
A button is provided for this purpose."

Understand now ?

AB4VV,

Your anger towards this group is beyond ridiculous. This group owes you nothing, so your frustration at not getting your desired answer is misplaced. If you have questions you want answered before you plunk down your cash, then call Tentec. They're the ones who owe you answers since they stand to get your money.

IMHO, what is childish and petty is your threat to leave the group over your dissatisfaction with the answers you've received.

Enough.

This is hogwash. The 2.5Khz per revolution is fine for tuning up/down while looking for signals. To tune fast, you just tap the "Main RX" button and X100 tuning rate is engaged for fast tuning. After you get where you want, you tap Main RX again and X100 is turned off. Easy as pie.

Right........friendly is as friendly does.

I believe the Yahoo Orion, and Omni VII are great groups for the most part.

However,

This guy did the same thing on the Omni VII group too with his misunderstanding of pass band tuning, roofing filters, etc, and just basic HF receiver design. It's one thing to ask questions, but if an operator doesn't have a clue on how the basic controls of their equipment works, and won't spend the time to read the manual and figure it out them self, or at least make a diligent attempt to do so before asking questions, perhaps they have no business with the equipment to start with.

Ten Tec, any other equipment mfr, or any internet forum/email reflector is not obligated to teach an extra class operator basic HF radio XCVR design, and basic equipment operating skills.

Out of all the radios I have, the Orion II is one the most simple to use in any mode it is capable of. I also have the PROIII, the IC7700, and the R&S XK2100. I love all my radios for different reasons. If someone told me I could only keep one of the 4, it would be a very close tie between the XK2100 and the 566AT.

I've been in aircraft maintenance, and avionics (aircraft electronics) for over thirty years. Ever took an inventory of the mechanical & electronics/electrics/hydraulics/pneumatics/environmental systems in a moderate sized CAR 4, or 14CFR part 25 aircraft such as a Gulfstream GII/II/IV, or a Bombardier Global Express? 2-way radio communication equipment is a very small part of all the systems that an aircraft has. With the proper test equipment, and the aircraft and equipment manuals, I can (and have) trouble shot most any system in the aircraft, and effect a repair.

None of that is any big deal at all. It doesn't make me any smarter, or any better than any one else.

But......knowledge of the basic mechanics and electronics goes along way, and also knowing how to analyze a situation goes a long way to figuring out a gamut of things electronic, electric, and mechanical.

Passing any kind of a test for a license (virtually any license) now, or 30 years ago is not indicative of how much real usable knowledge the licensee has. My dad let me work summers for him in his radio shop when I was a teenager, but only after I studied for and got my FCC First Class Phone (now GROL) license. Tested in front of good ol' Uncle Charlie examiner in downtown big "D", TX. I didn't start learning anything about radio until I started working on them. Same then as it is now. And yes, certain circuits were drawn from memory. Sound familiar? Formulas and their understanding from memory in order to work the theory problems. Sound familiar? Could I properly draw any of those cartoons today, probably not. Could you?

I've had my FAA Airframe and Powerplant license for 22 years. Question pool for A&P exam is 2400 possible questions. For the A&P three paper exams, and oral and practical exam in front of a Designated Mechanic Examiner. General-50 questions, Airframe-100 questions, Powerplant-100 questions. And only after you pass those paper examinations with at least 70% correct, are you entitled to take the 8 hour Oral and Practical exam in front of the FAA examiner.
Yep, knowing the material vs. memorizing the questions is the way to go.

I didn't know much about aircraft until I started working on them. But, I had to have the license first before I could. Same then as it is now.

"It is a great hobby."

Yes it can be. As with many things, you get out of it what you put into it. Please kindly don't assume that just because some has only held their ham license a couple of years, that they don't know squat. I've met some absolutely wonderful people on HF, that were extremely knowledgeable about radio, and antenna systems. And, I've also met some "professional hams" that have had their licenses for a long time that were the antithesis of the aforementioned.

"Please keep all responses friendly."

Yes it takes a good faith effort from all parties to do so. It can't be one sided. That won't work. And its even more ridiculous for some childish thespian to come in and make an issue of some silly nothing because they can't figure out some of the most basic functions of the equipment, and go into some little crybaby tirade when good caring people are trying to help them, but aren't giving them the answer even the most basic operator could understand.

That's not right.

Enough said.

I hope we can all get back to reasonable, and valuable information exchange about the Ten Tec Orion I & II.

"Understand now ?

AB4VV"

This is what I clearly understand. You need to grow up. I don't know what your experience level is, or what your electronics background is. But one thing is clear, either you haven't a clue how even the most basic functions of a typical amateur radio transceiver are used, and work, or you have too much time on your hands and want to stir up strife in a decent internet group. These are good people here. They are under no obligation to spoon feed you basic knowledge that most reasonable operators already have that enables them to figure out things on their own, without coming into a group such as this and making a fool of themselves like you have. If you really wanted help, you would ask for it in a reasonable way, and respond to those that have tried to help you in a reasonable way also. With every childish response you put forth it is clear that the help you need is not of the technical kind.

You are acting like a golden spoon fed, spoiled little brat that cries foul when no one will come to their aid, and they are forced to put forth a little effort to do something on their own.

Stop it why don't you? Stop acting like a little gangster with a spray paint can on a graffiti run.

You did the same thing on the other Ten Tec reflector. Perhaps you are attention starved, and coming into internet groups such as this and making a fool of your self is one of the ways you satisfy your attention craved psyche. That is sad. If this was my group, I would have banned you by now.

This is the last bit of attention you get from me. Please grow up and have a little pride about about helping your self.

Hey, pal: neither I nor anyone else on this reflector owes you diddly squat.

Read the reports, just like we did.

Now, based on your questions here, the O-II is definitely *not* the
rig for you.

Yep. I am frequently amazed by some of the questions asked on
ham reflectors/lists/websites.
Simple things that seem to indicate that the person asking the
question didn't learn anything studying for the license test or
can't read documentation. If you point them to a source of
learning, they just complain. Sad.

S/N 07C10153 (July 2003 run 1 unit 15), S/N 04C10824 (April 2004 run 1 unit 82).

Both units have 250 Hz, 500 Hz, and 1.8 KHz TenTec roofing filters, the TenTec fan kit, and grey replacement VFO knob rubber trim rings. One unit has the V2 sweep hardware modification, done by TenTec. I am the original owner.

Working order, manual and all standard hardware and accessories, cosmetically clean, original cartons, service records.

Optionally available: TenTec 963 power supply and/or 302R remote encoder/keypad.

Used only certain weekends at a modest contest station in southern NH :-)

Contact me here: K1GQ at ME dot COM.

Bill, K1GQ

This is what I clearly understand. You need to grow up. I don't know what your experience level is, or what your electronics background is. But one thing is clear, either you haven't a clue how even the most basic functions of a typical amateur radio transceiver are used, and work, or you have too much time on your hands and want to stir up strife in a decent internet group. These are good people here. They are under no obligation to spoon feed you basic knowledge that most reasonable operators already have that enables them to figure out things on their own, without coming into a group such as this and making a fool of themselves like you have. If you really wanted help, you would ask for it in a reasonable way, and respond to those that have tried to help you in a reasonable way also. With every childish response you put forth it is clear that the help you need is not of the technical kind.

You are acting like a golden spoon fed, spoiled little brat that cries foul when no one will come to their aid, and they are forced to put forth a little effort to do something on their own.

Stop it why don't you? Stop acting like a little gangster with a spray paint can on a graffiti run.

You did the same thing on the other Ten Tec reflector. Perhaps you are attention starved, and coming into internet groups such as this and making a fool of your self is one of the ways you satisfy your attention craved psyche. That is sad. If this was my group, I would have banned you by now.

This is the last bit of attention you get from me. Please grow up and have a little pride about about helping your self.

Well that seems to answer your original question. So if you already knew the answer why bother to ask it. Sounds like the Orion is too good a radio for you. You may be better off with a 2 meter HT and a repeater near you with Echolink.

I don't think anyone thought your question was petty and childish. Your reaction to the answers you got were. I don't believe you are paying anything to have access to this list. Nor is anyone on this list obligated to answer any of your questions to your satisfaction.

I seriously doubt you will be missed good by and good riddance.

5213. Filter Options

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-12 10:27:26 UTC
From: Rob - G4LMW
Topic: 5213 Message: 5213

Hi Group

I have now been enjoying my Orion for almost one month - great radio (just wish the RF gain had its own control).

Anyhow, I have acquired an Inrad 600Hz filter.

My question is, should I use it to replace the Standard 1kHz filter or put it in the Optional 500Hz slot?

Replace the 1Khz filter - the low loss of the 600hz 4-pole filter
means you don't need the extra amplification stage (and lower dynamic
range) associated with the 500hz filter slot.

Thanks for the advice Barry

That is what I have now done.

Being a 99% CW op, now thinking about further roofing filters for the 500 (but I guess this is covered with the 600 InRad) and 250 Hz slots. Any suggestions?

5216. Supply Voltage

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-12 13:43:00 UTC
From: Rob - G4LMW
Topic: 5216 Message: 5216

Since it is my day for questions, here's another one.

I searched the archives and while there has been discussion in the past, I could not find any definitive answers.....

The manual states that the Orion should be run with a supply voltage in the range 12.8 to 15 vdc with 13.8 as the optimum value.

Can the radio be run from 12.0v ?

I ask because we have our Field Day soon and I was hoping to run 10W from some 6v/100Ah batteries in series pairs. Reducing down from 18v (3 cells) to 13.8 is more problematic.

Hi Rob...

I'm not sure that the Orion is a good choice to run 10w from a battery supply because it tends to be a huge power hog, whether you are running ten watts or a hundred watts. I would think that some other radio that is more energy efficient would be a better choice for battery power. Generator power would not be an issue. As for the voltage, I would guess that you could get away with 12v, but funny things do start to happen as the supply voltage drops, and with the length of wire to the radio my guess is that you may be well below 12v when you figure the voltage drop in the cable. Perhaps others in the group have had experience running the Orion on battery power, but I personally would opt for an older non-processor controlled radio that wouldn't be so power hungry.

Rob,

I would recommend getting 2 8 volt golf cart batteries. That would give you 16 volts. From what I have seen on the list, the Orion will not run properly at 12 volts.

73,

John

The 600hz roofing filter is all you need for cw in the Orion, based on
significant cw battle testing.

I had all the cw filters and found that the performance was outstanding with the 600 hz filter and use of the DSP. I almost never used the other cw filters and never felt the need.

Thanks Barry

It get very crowded on our Region 1 Field Day and there are some pretty big sigs around. Just wanted to make sure they were out of my passband - but if you have "soak tested" the 600Hz and it's fine then I guess I can save my precious pounds!

Thanks again.

Thanks John

But we'd need more than 2 (its a 12 hour contest). As regards to another posted suggestion that we try another radio more suited to battery power..... we just wanted the best!!

We have 6 pairs of 6v 100Ah batteries (or 4 triplets!). More than enough for the job - with a combined weight of around 600lbs!

I could run my FT-897 for a week on those beasts and it would be more than happy with 12v

Looks like we are going to have to build a switching regulator to down-convert 18v do 14v......

The problem is that the Orion has a fairly high minimum voltage
requirement. (Over 11 Volts, as I recall.) That means that you don't
have much headroom with a 12 V battery. Cable losses and/or low
battery will put you off the air. The standard automotive 13.6 V is
probably optimum. There are some switching boost regulators that can
keep your voltage up as batteries discharge. They might be a way to
go, but they will cost something.

So, what happens in the OII? Do the 250/500 Hz filters suffer from the same issue?

I see Inrad makes only 9001.5 KHz filters for the OII. Am I to assume these are direct drop-ins to the 250/500 slots in the rig?

Brad

No, Ten-Tec went to 4-pole lower loss narrow filters in the Orion II
without the extra stage of amplification used in the Orion for its
higher loss 6 and 8 pole filters.

So the inrad improvement would just be shape factor or the OII?

Brad

I just installe dit. The most obvious change is the way the sweep works. Spin the knob fast and put the dot on the signal and it moves to that freq.

Or move the knob slow to work it like you're used to.

Pretty cool

Date: 2009-05-15 03:22:00 UTC
From: ko4xj
Topic: 5231 Message: 5233

Other change is the

1.MENU-OTHER_"mic/pwr Setting" Either GLOBAL or PER BAND (?)
2. MENU - RX Sweep Display can be turned off, no more width adjustment
3. Menu - RX "AGC System Type" added to bottom of list. When you adjust the MULTI knob it reads "LOADING DSP CODE". Mine seems to cut the audio off or on. I know it has to more but no idea yet. (?)
4. The BW and PBT graphic is alot smaller and the display area of the bandscope is larger.. missing is the increment scale on the bandscope.

At first trial on 20 this afternoon, the band was really quiet but tonight on 40 the spikes are alot higher (signals and QRN) on the display.

IS IT ME OR IS THE AUDIO LOUDER..can't tell just yet

The contrast seems to be the same as the last version

The VFO has to be moving (tuning). The bandscope freezes the captured view I'm assuming so you move the dot to the signal you are interested in. Once you stop tuning the VFO it moves it back to center of the display

Topic: 5238 Message: 5238

Successful update here; 10693 lines in just under 6mins run from WinXP running on VirtualBox on top of Ubuntu (Linux) using an USB to Serial adapter.
RF-AGC and AF-AGC now have equal volume, and Sweep-Display now seem to behave properly.

So far so good...

Didn't think about the contrast. My first wish on the new display, make the "dot" a line so it could be seen without straining or without the reading glasses. Then make the BW and PBT graphics bigger as before. Minor items but that's a first impression for now

The procedure is given in the notes that are distributed along with
the software update. Which is a little stupid. You have to unpack
the file in order to find out how to unpack it, etc.

Here is the HowTo.txt file:

Updating the FLASH FIRMWARE on Ten-Tec Orion

1) Turn Transceiver OFF.

2) Connect a PC to the transceiver using the appropriate cable.

3) Turn the Transceiver ON while holding down the USER2 button.

Wait for display to indicate "Flash Update Mode"

4) Start the Update program

5) Select the COM port to which the Transceiver is attached.

6) Choose UPDATE under the PROCESS menu.

7) Select the RUF file under the Process Menu.

8) The program will update the radio and report any errors
encountered. During the update

process the Orion screen will indicate the current line being processed.

9) If a master RESET should be done it will be indicated on the screen.

Well, several hours later, it seems to me that the "Red Screen" only
occurs when using the "AF-AGC", Three hours straight running with
"RF-AGC" has been entirely uneventful.

5246. Audio Volume & Menu Item

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-15 22:09:55 UTC
From: kd6hq
Topic: 5246 Message: 5246

I've been using a barrowed Orion 1 for about a month now.
One thing that I have noticed from the begging is that the audio seems a little low from the internal speaker. Looking at the volume bar on the display it seems to take about 25% of the bar to begin hearing anything at all. I don't really consider this to be a problem because a comfortable level can be reached somewhere around 50-60%. I have also noticed that full volume seems to be about 90% of the bar. After that point the bar no longer adjust so that a 100% bar level cannot be reached.

So my question is does this seem to be normal or is there a potential problem here?

I was also asked by the owner to do the modification for the sweep function and upgrade the firmware. This has been done and in doing so I have noticed one menu addition called "H/W Mic Gain" under the SSB menu. Since this radio went from the original firmware to 2.062a (now 2.063xg) in one download I seem to have missed the explanation of this function. Would someone provide a short description please?

Thank you

Don kd6hq

I am still noting the problem with the programmable AGC threshold and the s meter response. Typically as the threshold values are increased the s meter increases. I have intermittent operation of that again, just like 2.041XL.

video here:
www.w1nt.com/filetransfer/smeter_progagc.avi

5248. 2.063Xg Items

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-16 00:30:45 UTC
From: John T. Fleming
Topic: 5248 Message: 5248

I have a fix for my lack of marks on the sweep display. I took a small piece of "frosted" clear tape and put a small strip of paper under it. I cut the tape length wise so it would fit between the display and the bottom buttons. I then reloaded 2.062a and marked the tape with the steps away for the received frequency. I needed the narrow strip of white paper under the tape for contrast to see the black pen marks every 10 KHz.

The next problem I noticed is the "dot" that moves if you change frequency. If you turn off the radio with the sweep operating, when it is turned back on, the "dot" is missing. Cycling the sweep off and back on restores it.

73,

John

Rob,

I stuck the tape to the curved black at the bottom. That is why I had to put a strip of white paper under it to see the black pen marks. I am hoping Ten-Tec will restore some version of the marks. Now that we no longer have the option to change the sweep width, the marks can be "fixed." I am on my second display. I had a line across it. I think it cost about $200 plus labor for the repair PLUS the freight! I put nothing on the LCD display.

73,

John

Priceless - thanks for the laugh Rob!

Haven't looked at my sweep in several years and could care less if it's been improved. Waiting for some comments on whether AGC/gain distribution has improved, but not in any hurry either.

Barry,

I operate a lot on traffic nets. When I am the net control, the sweet display is a valuable asset.

I noticed that when I am running the AF AGC that the noise from my plasma is less noticeable than with the RF AGC. I need to do more experimenting on this to see if it was just fact that my roof is wet from the rain compared to when I had used the RF setting. My antenna is tucked under the shingles because of the restrictions. There is a picture on QRZ.

73,

John

566_2.041XT FW (Beta.....noticed audio distortion with NR voice & CW modes. Back to 2.041XL, no distortion. Will try XT and different settings when time permits. XL was fine, and didn't notice display quirks others reported. Just curious what XT would do for my 566. Now I know. No worries XL is fine for me. I'll bet I'm overlooking something with XT. Will report with findings as time permits.

Hi Guys
I will soon have a Ten tec Orion 565 the 1st model I already have the Perseus SDR and a Elad Switch Box but my question is can I link the Orion and the Perseus in a similar way to the FT-2000 owners so that I can use either the Perseus Receiver or switch and use the Orion receiver or both at the same time ??? I know the FT-2000 guys use the RX antenna out socket but I believe the Orion only has a receive antenna in socket ??? anyone got any ideas ???
thanks in advance Ian 2E1RDX

Hi Neil,

I have an AL-811 I use as a back-up amplifier for my AL-82. I use an SWR bridge between my Orion II and amplifier. The amp goes into a 1 KW dummy load. I drive the amp with only about 10 watts or so and adjust the slugs for the minimum SWR between the amp and radio. With minimum SWR, you not only get a low SWR for the radio, but maximum output from the amp too! I've used this procedure for the AL-82 also as well as other amps. On the AL-811, you must adjust the SWR on the bands you use the most. An example is the 15/17 meter coil. You get a flat SWR on one or the other, but not both bands. Good luck!

Hi to all,

Just came back from Dayton where I bought remote encoder/keypad.
The guy who sold it said that it was working fine but when I hooked it up it appears that the main knob has a gap roughly 30-45 degrees where turning it doesn't produce any frequency change. Is there any known fix for this kind of problem?
Thanks in advance,

Yuri VE3XB

I have just loaded the current BETA version, and after many hours of use I can say all is OK: actually I like the new sweep display... :-)

I noticed perhaps a slower action of threshold AGC when setting low uV values, it seems like the quantization has been recalculated...
Am I wrong ?
Any one noticed this behavior ?

Best 73 all !

Greetings,

Yes i did notice that. For very low (small) values of threshold it seems to take a lot longer then it used to take. At first I doubted the encoder and though it was broken somehow....

I also found a couple of other issues which I documented in my logbook.

Somehow it seems Ten-Tec would benefit by providing a "found issue" bulletin board where ten-tec users can post the issues as found. Today there seems to be no feedback mechanism so whatever found needs to be "escalated" somehow...

Best regards,
Onno pa1ap

Hi Onno,
thanks for your kind reply, now I have a confirm
there is no need to replace my encoder... :-)

Your findings are really interesting, and I absolutely agree with you:
a feedback mechanism would be very useful both for us and TenTec, why
not to start with it ??
If someone has a direct line with the factory it would be nice to have
a confirm and an "imprimatur" by them...

In any case, for the moment this BETA version is playing well with me...
On the other side, I am not so sure to load the new BETA on my ORION
II, after having read some comments here on the reflector...

I have found 2 problems with the Orion 565 Beta firmware. I have reported them to ditsnbits@... and received an auto-acknowledgment. The problems were:

(MINOR) When the AGC is changed from RF AGC to AF AGC (or vice versa) the Orion serial port shuts down. A reboot of the Orion eliminates this problem. (Since a reboot of the Orion is necessary for the AGC change to take effect perhaps that should be noted in the onscreen loading of the DSP). As mentioned a minor problem.

(Significant) When using the AF AGC the audio almost disappears completely when the NR is engaged at any level -- even a "1" will cause the problem. On my Orion the volume at MAX level gives only very weak audio. It's in there but it is very weak.

Tnx Rick for the serial port issue.. had not found that one yet but knew about the Audio issue..

My issues (wants) are

- BW & PBT boxes are too small..bring back the larger as in previous versions
- Use some type of frequency markers in the bandscope space for reference
- Use a vertical line marker instead of the dot on the bandscope
- Plus the fixes you mentioned

Seems like there was another one but will think about it later

Subject: [orion565] Re: new Orion 1 beta version

I have found 2 problems with the Orion 565 Beta firmware. I have reported them to ditsnbits@tentec.com and received an auto-acknowledgment. The problems were:

(MINOR) When the AGC is changed from RF AGC to AF AGC (or vice versa) the Orion serial port shuts down. A reboot of the Orion eliminates this problem. (Since a reboot of the Orion is necessary for the AGC change to take effect perhaps that should be noted in the onscreen loading of the DSP). As mentioned a minor problem.

(Significant) When using the AF AGC the audio almost disappears completely when the NR is engaged at any level -- even a "1" will cause the problem. On my Orion the volume at MAX level gives only very weak audio. It's in there but it is very weak.

Greetings,

Is there a way we all can contribute and structure our findings in such way we dont overflow ditsbits with repetitive questions?

A structured question log would benefit tentec development which translates into faster resolution for us "customers". And when we all focus on the same log we can duplicate verification much easier as well.

I have raised this suggestion to tentec sales and they actually refered to this forum :-)

If the community would maintain a "bug list" and we share the bug list with tentec our chances of quicker resolution will be much higher since it would become a community message to tentec instead of individual message.

I am not sure what we can do using the yahoo applications but if the group appreciates I can certainly investigate this.

Best regards, Onno pa1ap

Rick,

I just did an A/B test on audio level between AF AGC and RF AGC. The RF AGC audio level is notably louder, whether the NR is employed or not. Given that the audio levels in the Orion I 2.0+ version software are too low to begin with, this dictates RG AGC use for me, at least for my lowband DXing habits.

Using RF AGC indeed the audio sounds louder but there is also distortion due to clipping and no matter what setting this remains present. When stronger signals appear I also noticed "plopping". Does any of you noticed the same? I have capture the clipping and plopping on visual audio capture and can post it if needed. I am using AF AGC for now and dont use the NR since it indeed makes the radio very silent...

I recall that one of the 1.3x code developers once wrote that AGC has to be adjusted when NR is switched on to avoid complete audio silence. Seems to me this might be the case using the previous firmware.

Isn't this the same gain distribution problem that has always plagued
v2 firmware running on the Orion I ?

From: pa1ap
Topic: 5231 Message: 5280

It seems that way when using RF AGC mode of operation. I have downgraded to 2.056 and the issue was gone again.

There are many improvements which motivate me to stick with release 2. I have downgraded to 1.372 to see how it feels and runs and I did not like what I found (before I liked it a lot). Upgraded quickly after that to latest beta again. Rig control response, LCD contrast and even the sound is much better in release 2.056. Even cw memory surives a power cycle now...

Anyway, i will stick with the beta for a while to drive it and isolate bugs as much as I can. Another bug is that the internal tuner might be switched on while its not indicated. At first I thought my antenna was broken but I measured with antenna analyzer perfect swr. Then I disbaled the tuner through menu and swr was as expected again. All the time no indication of tuner in lcd screen...

Its great we can run multiple images and almost customize the rig to what a person would accept.

Best regards,
Onno

I will create a report and post it on the forum as well.

Below an example of the comparison between 2056 and 2062 and AGC clipping resulting in high frequency hiss (check the files section for agc folder).. Today 2056 is still my favorite release 2 version but the last beta fixes something I really appreciate; the lcd contrast stay stable... no more changing between cold and warm... whatever they did in the new firmware they addressed the lcd driver routine!

About the beta, I have noticed that after switching from AF to RF agc and back, the serial interface doesn't work anymore until a power cycle.

Also more importantly when on AF AGC, on the programmable setting, main receiver, when I set the decay to 1dB/s some strong pops can be heard continuously over the audio. This also happens when I press the multi knob to set the default decay rate (which then changes to 1000 dB/s). Even more strange is that when I select the 1000dB/s rate by turning the knob, not pushing it, the pops do not appear. Please confirm this someone!

Dan, <and TenTec> I can replicate this with same "popping"
on the O II also using the latest XL beta for it ...

<I did NOT notice the serial port issue using N1MM as the
test software, never lost freq control from the O II to the PC>.

I have also seen the red screen on RF AGC. I can get rid of it moving to the waterfall and back again.

I have now also seen the "Red Screen" appear when running "RF-AGC", so this one has definitely not been put to rest....

First problem <serial port> could not be replicated here with 2.041XT/O II.

Second problem <NR w/AUDIO AFC> COULD be replicated w/2.041XT/O II.

I am running the same tests, but with the Orion II to compare results
and with the understanding that much of the code <Orion & Orion II>
is the same ... my guess is if the same problems are common to both
platforms and BETAS, then this may help with the improving of both.

5286. Navigator interface?

Yahoo group: orion565 (2009 — 2013)

I am looking at purchasing a Navigator US Interface for my Orion (565).

Here's my current set-up:

Logger32 (logging, FSK and PSK)
SteppIR antenna
N4PY rig control

I'd appreciate any feedback on this interface. In particular can you UPDATE the Orion's firmware using this interface? Any problems or possible pitfalls?

Thanks.

Rick
I know that I answered this in a PM to you but I thought I would include it here ☐ for the group.

As far as updating the Orion software with the serial port on the Navigator - Yes, it does work. In fact I also use that port for Rig Control. So what I have setup is a USB connection to the Navigator and a serial connection to the Orion thru the Navigator. So I did not have to purchase a USB to Serial converter or an additional serial port on the computer. On my system this is all done thru the "virtual" (Navigator setup) comm. port #8. So of course the download software (Orion) program needs to use the same comm. port when transferring files.

I am getting a loud pop when I turn down the volume rapidly, regardless of what the AGC setting is, when in AF AGC mode, after setting the "default" of 1000 dB/s, and it goes away when you change the default setting away from that 1k dB/s, even if you return it to that setting manually. I think this is basically the behavior you are describing.

Sometimes (in AF AGC mode) the AGC settings for threshold won't change until you leave the menu page and go back to the "main" screen. Thus far I can't figure a particular input that will result in this behavior; it seems fairly random while changing around the threshold and decay on the AGC. I just checked and confirmed that this is also happening in RF AGC mode after a reboot. And it appears to be JUST the meter, and not necessarily the audio (at higher decay rates, the audio seems to change but the meter stays stock still if you have cranked the threshold way up and then "default" it to 1 uv, or turn it down with the multi knob). Hm, in playing with it a bit more, it seems that sometimes the needle freezes when you change the threshold. I'd mistaken that for having the threshold turned up above the noise level, which causes the meter to rise up above the noise level indicated and then the needle stands still; in fact it is freezing, since I found that I could get the needle to freeze even with extremely low settings, and leaving the menu page for the main screen would set the needle moving again to indicate the actual real-time noise level.

I am also having a lot of trouble with the display. When I switched the rig on after the firmware update, the screen was so low in contrast I couldn't see anything on it at all! And it was changing slightly, almost like flickering, at first. After warming up a bit, I muddled my way through the menus by memory and with dim visual cues to reset the contrast level. I still have to make some changes in contrast while the rig is warming up, but I get to a final setting much more quickly than before. However, the difference between "percentages" seems to be much greater than before when cold, and much lesser than before when warm, which means I have a much harder time reading a cold screen until it warms up. At least before it was legible when I powered on and had the warmed-up setting in the radio!

Well almost, I am talking about a continuous series of pops being heard when I set the decay to 1dB/s or push the multi knob without touching the volume knob.

Also I can confirm the meter thing, I saw it also but did not pay attention to it at first.

But I have no trouble with the display and had some before, e.g. it was changing backlight/intensity at random.

5291. Thinking about an Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2009-05-24 02:52:47 UTC
From: David Little
Topic: 5291 Message: 5291

Hi All,

I new to the group and am thinking about trading a Yaesu FT-2000 station toward an Orion II.

I have most everything but the micro tuning units on it: FT-2000 transceiver, DMU-20000 Data Management Unit, SP-2000 External Speaker with filters, MD-200 microphone with optional Heil HC-4 element as well as the stock element, 15" LCD Monitor, keyboard and additional hardware to run Linux on the DMU instead of the Vertex OS.

Am I moving in the right direction?

I am interested in getting the best receiver I can in the under $5000.00 price range.

Currently, in the shack I have Yaesu FT-2000 setup, Kenwood TS-2000, Ten-Tec Jupiter and Yaesu FT-450AT. Each can run voice or digital, only limited by antenna selection.

I operate mainly voice, enjoy ESSB, and also like to have digital sound card modes available on each rig.

Ideas?

David

Hello David. I run the Orion II as the main rig. Also like the FT1000 MP MK V fully loaded with the Inrad filters. It is real close to being as good on receive as the Orion. I run a 706 MK II G for 6 and 2, and often can be found on the Collins S line where the 75S-3B receiver can pull in the signals with the best.

I have an orion, a pegasus, a ft 990, a scout, a ts2000 and ft 847 and a couple of 857 d's and an Icom 746 pro.

I use the orion 99 percent of the time, I even have a TT 6 m transverter for the orion, it is that good, second would be the ft 990 I guess, the orion is great

Hi David, You will not be disappointed. In December I decided I wanted to try the FT2000 and found a ham in Ca. that had the radio, speaker, DMU, and tuning unit for 40/80. I traded him even for my Orion II and when the 2000 got here and I hooked it up I was sick. It was so noisey I couldn't stand it and he wouldn't trade back.LOL Then the new software came out and it made the 2000 like a new radio but it was still no Orion. The way the 2000 prices fluctuate I figured I was stuck and would have to sell and add money to get back to the Orion. But I advertised it and was lucky enough to find another O2 owner that wanted to try the 2000. I made the trade and will not let this radio leave the bench. When it gets down and dirty the Orions will hear signals the others don't, plus if there is interference I can find a way to still work the station. I'm sure if you made your post on the 2000 group you would get a whole other bunch of recommendations LOL but
this is my opinion and for me there is no comparison. 73 Dave

David and All,

Personally I can't imagine why you would trade an Orion II for the 2000. It would have to be the VHF/UHF capability I guess. Actually, I do know a couple of very competent HFers who have acquired the 2000, and are very happy with it. But it is the VHF/UHF factor that motivated them. One of them has an IC-7700 and several other high end HF radios, so it was to fill a gap. The other loves VHF/UHF contesting and roving, so the 2000 gives him some real versatility in that part of the spectrum.

If you aren't similarly multi-radio equipped, and HF is important to you, the 2000 will probably be a big disappointment from everything I have read about it--at least in comparison to the Orion II, or similar HF standouts. Just looking at Sherwood's website shows the inadequacies of the 2000 in comparison. The 2000 has been around a while, and is starting to get some "hair" on it. It's a situation similar to the IC-706. Even the IC-703 has a better receiver. I think it's a real shame that Kenwood doesn't seem inclined to effectively compete on the higher end of the HF radio market. I think they know how to make a good one, they just don't seem interested in doing it. Kenwood has made some really fine radios in the past, and even the TS-480 is still a star in its category. I suppose though, if you want one radio that can more or less do it all, the 2000 is a good choice. It's probably not very realistic to expect one radio to do "everything" with equal competence. If you operating objectives on HF are "casual", the 2000 will probably do fine. However, you won't get that "warm, fuzzy feeling" with it that you would with an Orion II, or several other upper end (but not necessarily top end) radios.

Hi David, You will not be disappointed. In December I decided I wanted to try the FT2000 and found a ham in Ca. that had the radio, speaker, DMU, and tuning unit for 40/80. I traded him even for my Orion II and when the 2000 got here and I hooked it up I was sick. It was so noisey I couldn't stand it and he wouldn't trade back.LOL Then the new software came out and it made the 2000 like a new radio but it was still no Orion. The way the 2000 prices fluctuate I figured I was stuck and would have to sell and add money to get back to the Orion. But I advertised it and was lucky enough to find another O2 owner that wanted to try the 2000. I made the trade and will not let this radio leave the bench. When it gets down and dirty the Orions will hear signals the others don't, plus if there is interference I can find a way to still work the station. I'm sure if you made your post on the 2000 group you would get a whole other bunch of recommendations LOL but
this is my opinion and for me there is no comparison. 73 Dave

Subject: [orion565] Thinking about an Orion II

Hi All,

I new to the group and am thinking about trading a Yaesu FT-2000 station toward an Orion II.

I have most everything but the micro tuning units on it: FT-2000 transceiver, DMU-20000 Data Management Unit, SP-2000 External Speaker with filters, MD-200 microphone with optional Heil HC-4 element as well as the stock element, 15" LCD Monitor, keyboard and additional hardware to run Linux on the DMU instead of the Vertex OS.

Am I moving in the right direction?

I am interested in getting the best receiver I can in the under $5000.00 price range.

Currently, in the shack I have Yaesu FT-2000 setup, Kenwood TS-2000, Ten-Tec Jupiter and Yaesu FT-450AT. Each can run voice or digital, only limited by antenna selection.

I operate mainly voice, enjoy ESSB, and also like to have digital sound card modes available on each rig.

Ideas?

David

Dave,

I appreciate the reply and the time it took to make it, and all good points.

However, we were comparing it to the FT-2000, not the TS-2000 (although I have both)

Also, the Sherwoood Labs test results may be on the Kenwood R-2000. If so, it is about 30 years old.

Many see this test report and assume the 200 in R-2000 is actually a TS-2000.

You may have found results on the TS-2000 as well, which well noted to not be as good on HF in the receive department as the FT-2000

The TS-2000 would be the rig I would keep if it was mandated that operators could only have 1 rig to operate from, as it is the ideal shack-in-the-box.

Still Considering the Orion II, Elecraft K3 and now Flex-5000A.

I would have to get the options in them to bring them on parity with the FT-2000, so it is a decision I will take some time with.

Thanks Again,

David

Subject: Re: [orion565] Thinking about an Orion II

David and All,

Personally I can't imagine why you would trade an Orion II for the 2000. It would have to be the VHF/UHF capability I guess. Actually, I do know a couple of very competent HFers who have acquired the 2000, and are very happy with it. But it is the VHF/UHF factor that motivated them. One of them has an IC-7700 and several other high end HF radios, so it was to fill a gap. The other loves VHF/UHF contesting and roving, so the 2000 gives him some real versatility in that part of the spectrum.

If you aren't similarly multi-radio equipped, and HF is important to you, the 2000 will probably be a big disappointment from everything I have read about it--at least in comparison to the Orion II, or similar HF standouts. Just looking at Sherwood's website shows the inadequacies of the 2000 in comparison. The 2000 has been around a while, and is starting to get some "hair" on it. It's a situation similar to the IC-706. Even the IC-703 has a better receiver. I think it's a real shame that Kenwood doesn't seem inclined to effectively compete on the higher end of the HF radio market. I think they know how to make a good one, they just don't seem interested in doing it. Kenwood has made some really fine radios in the past, and even the TS-480 is still a star in its category. I suppose though, if you want one radio that can more or less do it all, the 2000 is a good choice. It's probably not very realistic to expect one radio to do "everything" with equal competence. If you operating objectives on HF are "casual", the 2000 will probably do fine. However, you won't get that "warm, fuzzy feeling" with it that you would with an Orion II, or several other upper end (but not necessarily top end) radios.

Hi,
I have an orion II and runing the latest beta firmware and the strangest thing just happend. I was controlling the radio through the HRD program and I clicked on the cluster under some 6 meters contact. Guess what... the radio turned the freq. counter to the 6 meter band. No signal, no way to transmit or change the frequency through the dial but with the HRD I can make it appear on the main screen.
A bug of the latest software?

5307. Orion 1 firmware version 1 or 2

Yahoo group: orion565 (2009 — 2013)
Date: 2009-06-10 10:54:38 UTC
From: Mick
Topic: 5307 Message: 5307

Hi all,

I have just bought a 2004 Orion I and had to do the logic mod to make it Version 2 capable. I have sucessfully tried the 2 latest versions of firmware version 2, but have reverted to the latest version 1.

I have a few questions regarding the version 2 firmware:

Has anyone else noticed that the S meter will not go below S3 when the antenna is disconnected?, this does not happen in version 1.

Version 2 receive quality appears different to version 1, is this something to do with the difference between the way the receiver works under the 2 versions.

I like the feature of the cursor in the scope, but do not like this at the detriment of the shift/width indications on the display. Perhaps a vertical line from top to bottom of the scope would be better, while mainining the original scope size and layout (including khz markers). Not sure if this is posible with the way the display works.

Any coments on firmware version 1 and 2 differences would be welcome.

Topic: 5307 Message: 5308

Greetings,

Congrat on your orion I. Its a great rig.

I would recommend to try the following versions and run each version for a while to get used to its behavior and sound.

1) 1.0372 (good dsp NR function, good AGC but without indication, slow control, lower lcd resolution)
2) 2.065 (moderate dsp NR function, good AGC with indication, good control, higher lcd resolution)
3) latest beta (buggy dsp NR function, moderate AGC (AF & RF), quick control, high lcd resolution)

In release 2 they seem to be struggling with the AGC function a lot. AGC artifacts within the audio passband generate undesired noise. Those artifacts are a lot less in 1.0372 firmware.

This is my observation, other hams might have different opinion. Your miles might vary.

Best regards, Onno pa1ap

Mick: If you want the receiver to hear weak signals well and have it wok as well as it can under extremely crowded band conditions use version 1.373b5. If you want the scope/s meter etc to work then version 2 will be your choice. As in much of life there are trade-offs. Optimize it to hear well or to to use some of the bells and whistles. Others will have different opinions. I'm still on 1.373b5 myself and NEVER turn on the bandscope. 73 bob de w9ge

Thanks for the replies, I am sticking with the version 1 for now as the receiver sounds more to my liking, probably the AGC.

From: Mick
Topic: 5311 Message: 5311

Hi again,

My orion 1 came with a Studio One mic. I am having difficulty getting the mic gain to bring on the ALC light on peaks with this mic, although i have made one ssb contact so it seems to be working.

Is this normal for the studio one?

It's difficult for me to check anything now as i am not in the same location as the radio, but comments from anyone with a studio one mic would be welcome.

I may buy a second mic to check that someone has not adjusted the mic gain on an internal pot.

Mick

Hi everybody. I just took delivery on a new (to me) 565AT, running v2.062A software. You have probably heard this many times before, but I need some help in determining a good set of settings to use or at least start with. I am mainly an SSB operator and like to have enough punch in my audio to be able to work a dx station now and then. It seems as though I do not have as much drive for my SB-200 as I did with my Icom 765. I suspect this is due to not having the transmit audio set up correctly. Any help would be appreciated. Thanks very much and 73,
Mike, WC0L

Tom,

Many thanks for the response.

Once I am reunited with the radio I will do some more tests on air to see how it is performing. I am using about 70 mic gain and 4/5 SP. Not sure if the inbuilt meter shows peak or average power. I will also try an external power meter to see the real output. I have had contacts on air without complaint so i guess all is well.

Thanks for the info.

Mick

Hi Sam, tnx.
My 565 doesn't have that option. I should check for new firmaware for 565.
The 566 has "Line Out Src" and "Line Out Level", but not the 565.
tnx for help.
73 Frank

Please keep in mind there is a design error for both Orion 1 and 2. There is +5V DC on the audio output and when you use a 600 ohm 1:1 transformer to isolate the audio you run into core saturation as well significant audio distortion. Peter oz1pif detected this and we got confirmation from tentec bitsndits we should really insert a capacitor to remove the dc component.

Hope this helps, Best regards, onno pa1ap

From: pa1ap
Topic: 5311 Message: 5322

I have used studio mic (AEG 3000 etc.) which had extreme flat frequency curve (perfect for voice recording) but on HF trx those mics never worked well for me. On the orion it seems the AGC hears pretty much the whole audio spectrum and does not follow the filter curves as applicable for transmision... I got the feeling my low bassy voice triggered the AGC even outside the desired tx audio band. This caused the AGC to kick in very unexpected with the result the ALC LED did not light up when I expected it to do. You can insert a capacitor in line with the mic to move the center frequency upwards but its remains a work around for the issue of "perfect" studio mic's. I believe you are better of using a mic which has a frequency curve between 100 and 4 Khz, with a peak around 1200 Hz or so.

I am no using the 708 mic from ten-tec and its a really good mic combined with the orion. I did have to adjust the mic potmeter (i have set it to max gain) and i have set the mic adjustment at around 90. This setting combined with TX eq at -5 works great for my voice and setup.

Best regards,
Onno

Tnx Onno,
my interface do have the capacitor at the input of the amplifier stage. Tnx for the info. I was looking for some trimmer in the amplifier board to regulate the output level. Any idea if it exists and where it is located ??

tnx Frank I2DMI

Hi all,
I agree with Onno, 708 and 709 mikes work incredibly well
with ORION I & II, OMNI VII and JUPITER, I strongly recommend them !
Current TenTec mikes somewhat outperform several more-priced
microphones by other brands.

I dont think there is such potentiometer to regulate the output. According the manual you should see 1Vtt if I recall correctly. Perhaps you can hook up an oscilloscope and verify if the output matches this spec?

Good luck! 73 onno

5326. 565 low audio level on AUX socket - fixed with module from Radio Design Works

Yahoo group: orion565 (2009 — 2013)
Date: 2009-06-21 17:21:20 UTC
From: jeraldvolpe
Topic: 5317 Message: 5326

I punted a long time ago on this AUX low audio issue. I added adjustable low-level audio amplifier modules (external) from Radio Design Works. I have the ability to finely control the output amplitude regardless of which Firmware I use. In addition I use a low distortion Stereo amplifier from Radio Design Works and a pair of Minimus-11 speakers for Main and Sub audio..... In fact I use a series of these specialty audio modules.... interfacing all together with balanced audio connections so that all nine of the transceivers in my shack share all the same audio devices without the of switches nor any hum or RF pick..... However, it all started with the one stereo low-level adjustable amp due to low audio output on the AUX line.

> Hi everybody. I just took delivery on a new (to me) 565AT, running v2.062A software. You have probably heard this many times before, but I need some help in determining a good set of settings to use or at least start with. I am mainly an SSB operator and like to have enough punch in my audio to be able to work a dx station now and then. It seems as though I do not have as much drive for my SB-200 as I did with my Icom 765. I suspect this is due to not having the transmit audio set up correctly. Any help would be appreciated. Thanks very much and 73,

Hi, Mike. Well, audio is a tough one, as everyone's voice is different. This is one reason I tend to recommend getting some kind of parametric EQ to install between mic and radio. That way you can accomodate any combination of voice, mic and radio. My backup rig is a Kenwood TS-520S, and it has much different TX audio than the Orion, so being able to adjust the rest of my gear to make my voice with with various mics and rigs is a handy thing. If you only ever use the Orion and a single mic, you may be able to find a good combination that works well for you, but some of that is going to be down to trial and error.

As a general rule, if you have a mic that works well with your voice, almost any bandwidth and bass rolloff setting should be fine. My experience is that the ALC light generally stays lit almost all the time while I am talking to get solid drive out of the 565. As long as the needle is moving on the S-meter, that's probably going to be fine. I also use a crossed-needle true peak-reading meter, and put my face at speaking distance from the mike and make sibilants (like a "Puh" noise, with a sharp attack) and turn the mic gain down until the peak reading meter starts to drop off slightly, then nudge it back up until it has reached the max output on the meter at 100 power setting into a dummy load. I've used this method to set both the aux audio setting for input from my computer's sound card for digi-modes, and with my mic, and have never gotten a single report of splattering on digital, and nothing but great audio reports on SSB, once I got the EQ sorted out for a good response on my voice.

If you are on the US west coast, you can try tuning down to 3688 at night. From 7 pm to 3 am Pacific, there is a receiver in Pahrump, NV online that streams 3688, with about a 12 second delay. The audio response is pretty accurate, and I have used that successfully to tune my audio settings. Just because it sounds good in the cans using the MON function doesn't mean that once it goes through the radio's audio filters on TX it'll sounds quite like that, not to mention transmission and bouncing off the ionosphere. ;) You can also ask others for feedback on your sound as you change things, but that's down to whether they have good ears for that sort of thing. :)

The rcvr can be heard at http://www.smeter.net/pahrump/audio.php

I continue to have trouble with the display. If I set the display so that it is readable at switch-on, it fades out once it warms up. If I adjust it for correct contrast once it has warmed up, and then switch it off, when I fire it up after letting it reach room temp the screen is almost solid white. Screen contrast setting when cold is between 25 and 30, usually, and screen contrast setting when warm is between 37 and 41. Also, when warmed up and set for good contrast, the screen will FLASH in time with the peaks of my transmission as the supply in the radio fluctuates with power draw. It's not the power supply itself, as the voltage needle doesn't budge, and it's a 40A power supply that has no other draw while I am transmitting. The meter on the supply peaks at 14 A draw on peaks while TXing SSB voice. A high-impedance voltmeter confirms the lack of voltage change during TX seen on the supply's meter.

I also continue to have the problem of the MON setting sometimes jumping up to 100, without the setting being changed on the radio; pressing the MON button to highlight the MON setting, even without turning it off, will cause the MON setting to return to what is on the display. This continues to be through the rear external speaker jack, but I don't think it happening in the headphones. I may end up switching my Timewave DSP-599zx to the headphone jack rather than the rear external speaker jack if this keeps up.

Recently discovered, if the S-meter needle is "frozen" by the signal level being below the threshold setting for the AGC (using RF AGC), it often remains frozen while in the menu area, even if I turn down the threshold setting. It only unfreezes after I leave the menu area. This does not happen every time, but very often, and I have not yet found any correlation between whether it freezes or not and any other settings on the radio. I will, of course, keep looking. And I will probably switch back to the non-beta latest v2 firmware for Field Day, as I need the radio to work for me more predictably.

I have seen a few comments on other websites about a problem in the A9 supply board which sounds somewhat like your problem; The solution is to replaces the electrolytics caps with higher voltage/temp ratings.

From: ttalleur
Topic: 5231 Message: 5331

I have an Orion 1 for sale. Has most if not all the roofing filter options, desktop mic, speaker, and power supply along with handheld mic. I'm selling the unit because I haven't been on the air for more than 2 years. I've used it about 15 times. I sent it back to Ten Tec last fall to have the sweep / chip update installed. It remains in the original box back from Ten Tec unopened (I guess I should open it to see if they sent me a note!).

Contact me off net if interested.

Tom I'd be interested in what the "sweep / chip" update was? Is this the Version 2.xx mod or was something replaced in the Orion?

Perhaps the note will enlighten!

Thanks,

> I have an Orion 1 for sale. Has most if not all the roofing filter options, desktop mic, speaker, and power supply along with handheld mic. I'm selling the unit because I haven't been on the air for more than 2 years. I've used it about 15 times. I sent it back to Ten Tec last fall to have the sweep / chip update installed. It remains in the original box back from Ten Tec unopened (I guess I should open it to see if they sent me a note!).

5334. Orion 1 display issue

Yahoo group: orion565 (2009 — 2013)
Date: 2009-06-22 22:39:43 UTC
From: jddksk
Topic: 5334 Message: 5334

The display on my O1 disappears during transmit or blanks out then returns to normal operation upon switching to receive. I used to see this only when operating 80m now it's on every band. Nothing has changed in the shack everthing is still hooked up the same. These rigs seem so sensitive one day everything is working and the next I loose some sort of function I'm getting rea.....l sick! of doing master resets. Ok sorry I digressed anybody else having display issues?

Don't despair. It's not the rig. RF from the transmitter is getting into your power supply.which is not inside the O1.

If it worked before, something has indeed changed, even though you think it hasn't. The first two places to look are grounding and bypassing (usually of the 12v power cable). If RF is getting into your power supply, it doesn't matter how stout the supply is.

Try cutting back on the output power and you'll see the problem start to go away. This technique doesn't solve the problem but it will give you hints as you sneak up on it.

Bob/k8ki

5336. Re: new Orion 1 beta version

Yahoo group: orion565 (2009 — 2013)
Date: 2009-06-23 11:51:00 UTC
From: pa1ap
Topic: 5231 Message: 5336

Greetings Adam,

Hope all is well besides the technical issues. Get a couple of 10uF electric capacitors rated at 60 Volts or higher. High temperature would be good as well. On the dc-dc board there are a couple of them and replacing them would be good move.

Second, on the logic board there is a potentiometer which a 10uF electric capacitor close to it. This one is part of the contrast driving and connects to the center connector of the potentiometer. Replace this capacitor as well.

If you want me to figure out the exact component numbers let me know and I will dive into the schematics later this week.

Third, on my rig the potentiometer itself had a poor contact. Hence it gave unstable output to the LCD contrast pin. I replaced the potentiometer too.

Since then I have the following result;

1) with the latest BETA 2XG code -> the LCD screen remains very stable, no need to adjust the contrast at all. Cold, warm it does not matter anymore. Perfect... if they could just fix the rx issues i would use this code ;-)

2) with release 2.065 -> the LCD screen has only minor temperature sensitivity. I do have to adjust the contrast a little (from 50 to 55 or so) but its fine

3) with release 1.0372 -> LCD contrast is less stable and more sensitive to temperature. I have it now running White on Black and turned up the contrast to about 60 to start with... 30 -45 minutes later I go down to about 52.

This is on my orion 565.... You milage might vary but it might help to provide a reference on what I have running at the moment. At least you can compare.

If you want to measure first to see what might be broken I suggest the following;

1) solder a wire to the center connector pin of the contrast potentiometer and guide this wire out of the orion...
2) solder a wire to both sides of the contrast potentiometer and guide those wires out as well....
3) Make sure the wires can not shortcut, perhaps solder them to a connector of some kind

Here is what you should be able to see (measure);

1) one side of the potentiometer should have -22 Volt and this should remain stable the whole time. It should also be "clean" from any serious spikes.
2) the other side of the potentiometer should have +5 Volt DC PWM signal. You have to connect a scope to measure this
3) the center pin of the potentiometer is going to the lcd

In case the dc-dc convertor is behaving bad the -22 volt would be unstable over time or contains lots of spikes.

In case the PWM signal is distorted somehow, you know that the capacitors providing this signal might be bad... Unlikely but worth checking this way

In case the potentiometer has issues (like mine was broken) you would see that easily... I found this by measuring and putting some pressure on the logic board (at the corner near potentiometer) and I saw the signal going up and down quickly...

On measuring the signals and connecting those wires... Be careful not to shortcut or create an earth loop with the scope.

Best regards, Onno pa1ap

If I adjust it for correct contrast once it has warmed up, and then switch it off, when I fire it up after letting it reach room temp the screen is almost solid white. Screen contrast setting when cold is between 25 and 30, usually, and screen contrast setting when warm is between 37 and 41. Also, when warmed up and set for good contrast, the screen will FLASH in time with the peaks of my transmission as the supply in the radio fluctuates with power draw. It's not the power supply itself, as the voltage needle doesn't budge, and it's a 40A power supply that has no other draw while I am transmitting. The meter on the supply peaks at 14 A draw on peaks while TXing SSB voice. A high-impedance voltmeter confirms the lack of voltage change during TX seen on the supply's meter.

Hi Bob

The radio is run off 12v batteries and now that I think about it I put an amp meter in line to measure current drain that's probaly were it's getting in. I might have to put some by-pass caps and maybe some clip on chokes on the 12v line. I didn't think about the meter becuase it was right in front of me hihi never fails.

Dave,

The Orion needs 13.6 to operate properly. A 12 volt battery that is not being charged normally is not high enough to operate properly.

73,

John

Date: 2009-06-26 17:22:40 UTC
From: Petr Ourednik
Topic: 5340 Message: 5340

Hello,
I have for sale the Inrad #762 (600 Hz 9001.5 kHz CW 4-pole) crystal
filter. As most of You know this filter is designed to go into the 1 kHz slot in the Orion and it will improve the close in dynamic range by up to 13 dB.
Like new is offered for $65 (+ shipping).

Hello Mike,
I own both the rigs, and you will not be
disappointed in any case.

The audio quality is the same in RX and TX (both excellent), and all
considering the software system is comparable.
The ORION II has a bit more on RX performance, but you will notice it
not so often, believe me, and now with the last BETA software a nice
"real time" sweep display.
The OMNI, on his side, has remote-controlled capability via ethernet,
if you need this option.

Great rigs indeed, no surprises.

Good luck and enjoy !

5345. ORION and MIC Gain HELP HELP

Yahoo group: orion565 (2009 — 2013)
Date: 2009-06-30 18:48:37 UTC
From: n8lpq
Topic: 5345 Message: 5345

Hello All,

I am using an Orion. The latest firmware from Ten-Tec. I have both a 705 and a 706. Now when I use the 705, Mic set at 25 and the H/W Mic Gain at 0.0 DB. Some people tell me great audio, But a lot are telling me I have a echo or a hollow sound or empty room sound. Far from empty room hihi. Now I have not tried the 706 yet. I will try that one tonight. WHAT SETTING SHOULD I PUT THE H/W MIN GAIN IN THE SSB MENU. I am going to try the 706 tonight, Or should I use the 705??? H/W MIC GAIN first.
Thanks
Ed N8LPQ

Adam, thanks very much for your reply. I am having a great time with the Orion. I am noticing however, that it does not drive my SB200 as hard as my old IC-765 did. I could get 600 watts out on peaks with the 765, and more like 450 with the Orion. Without the linear, the Orion puts out a bit more than 100 watts on CW and the red light blinks and the meter swings on voice peaks, so I guess I have OK output on SSB. When I use the speech processor, people tell me there is more "presence" in the audio, but the light doesn't blink as often, and the output meter shows a bit less output from the SB200 that it did without the speech processor on. Any thoughts on any of this? Thanks very much and 73,
Mike, WC0L

You have probably heard this many times before, but I need some help in determining a good set of settings to use or at least start with. I am mainly an SSB operator and like to have enough punch in my audio to be able to work a dx station now and then. It seems as though I do not have as much drive for my SB-200 as I did with my Icom 765. I suspect this is due to not having the transmit audio set up correctly. Any help would be appreciated. Thanks very much and 73,
>
> Hi, Mike. Well, audio is a tough one, as everyone's voice is different. This is one reason I tend to recommend getting some kind of parametric EQ to install between mic and radio. That way you can accomodate any combination of voice, mic and radio. My backup rig is a Kenwood TS-520S, and it has much different TX audio than the Orion, so being able to adjust the rest of my gear to make my voice with with various mics and rigs is a handy thing. If you only ever use the Orion and a single mic, you may be able to find a good combination that works well for you, but some of that is going to be down to trial and error.
>
> As a general rule, if you have a mic that works well with your voice, almost any bandwidth and bass rolloff setting should be fine. My experience is that the ALC light generally stays lit almost all the time while I am talking to get solid drive out of the 565. As long as the needle is moving on the S-meter, that's probably going to be fine. I also use a crossed-needle true peak-reading meter, and put my face at speaking distance from the mike and make sibilants (like a "Puh" noise, with a sharp attack) and turn the mic gain down until the peak reading meter starts to drop off slightly, then nudge it back up until it has reached the max output on the meter at 100 power setting into a dummy load. I've used this method to set both the aux audio setting for input from my computer's sound card for digi-modes, and with my mic, and have never gotten a single report of splattering on digital, and nothing but great audio reports on SSB, once I got the EQ sorted out for a good response on my voice.
>
> If you are on the US west coast, you can try tuning down to 3688 at night. From 7 pm to 3 am Pacific, there is a receiver in Pahrump, NV online that streams 3688, with about a 12

second delay. The audio response is pretty accurate, and I have used that successfully to tune my audio settings. Just because it sounds good in the cans using the MON function doesn't mean that once it goes through the radio's audio filters on TX it'll sounds quite like that, not to mention transmission and bouncing off the ionosphere. ;) You can also ask others for feedback on your sound as you change things, but that's down to whether they have good ears for that sort of thing. :)
>

Mike,
my ORION I shows the same behavior.
I noticed a big difference in the SP effects between original ORION
and version II (I own both).

With ORION I : the best to do is NOT to use SP: audio quality is far
better with SP off.
Using SP, the audio is worse and power out is decreasing: strange but
true with me.
Anyway, power out is OK if you set your MIC gain on very high levels
(7-8), don't worry about red light blinking.

With ORION II : the radio sounds great even with SP, and output power
is higher WITH SP, a 6-7 setting of SP pot is OK even if MIC gain is
set to high values, say 7-8: no distortion at all in any case.

So, in my opinion, something has been changed (and improved) in the SP
hardware/software inside the ORION II.

Just my very poor 5 cents.

73 all !
FABIO, I0LBE

PS I am running the latest BETA software with both the rigs.

Hi Ed,

Well, I'm using a 705 mic on my Orion II and consistently get good audio reports. I don't understand your echo situation though. I have my mic gain(MIC) set at 25, the (SP) set at 3, and the TX EQ set to 12 dB. I did change the mic element on mine. I'm using a Sony commercial broadcast electret element used in the lapel mics for broadcast news anchors. Before I changed the element, I still got good reports. This element has a much flatter response than the original did.

Do you have it wired so that the audio return ground for the mic element is separate from the chasis ground and PTT ground?

Greetings,

It might just be the position and room causing your voice to echo throughout the room. If your voice (only) reflects at the facing wall you will get small echo but when the wall behind you reflects the sound again you will clearly hear echo independently of the mic used. Echo is a result of reflection and sound reflects well on empty walls. I dont know your radio-room setup so can't judge on how your walls, floor & ceiling looks like. Fixing the issue could be as simple as moving your position / location in the room.

http://www.smproaudio.com/produkte/mikrofon-serie/mic-thing-flexibler-mikrofon-isolator.html

Check the link above. This is what I have used for portable studio setup. You can easiyl make this yourself. What this provides is a non reflecting facing wall and hence echo is significantly reduced. You can make this from cheap sound dampening materials to see if this helps.

Other setup could be to put non sound resonating art work on the walls, such as the boring but effective van gogh or the less effective picasso paintings.. The expenses might be a bit higher though :-)

When you enable SP on the ORION it is expected the echo to increase in volume. SP does not know the difference between direct and indirect sound and hence it will attempt to boost both of them.

Hope this helps,
Best regards, Onno

Bill, would you mind explaining how you wired your 705 to separate the audio return from the chassis ground?

Thanks very much and 73,
Mike, WC0L

Fabio, thanks very much for your reply. It sounds like you have the ideal situation with a OI and OII. Maybe someday I will be as fortunate. Would you mind telling me what transmit audio settings seem to work the best for you with your OI, and what mic you use? Thanks very much and 73,
Mike, WC0L

Hi Mike,

Sure! As you know, the 705 mic originally used a 4 pin connector and used the PTT return, the mic ground return and the gooseneck and ground plate all on the same ground lead terminating on pin 2.

With my Orion II, I have the negative mic return going to the shield of the cable which in turn ends up on pin 7 of the Orion connector. The hot mic lead goes to pin 8 on the Orion connector. The PTT line goes to pin 6 of the Orion connector. The ground return for the PTT as well as the ground on the gooseneck and baseplate all go to the unused green wire in the coil cord and are attached to pin 5 on the Orion connector. The red lead in the cable goes to pin 2 of the Orion connector to supply B+ for the amp in the mic and bias for the mic element. Now, I hooked a .01µf disc cap and a 4.7µf electrolytic between the mic return and the PTT ground lead in the mic case where they connect to the PC board.

This gives me plenty of audio with no hum or RF pickup of any kind. One other improvement I made was to use silicone RTV to hold a 3 oz. fishing sinker in place where the battery would be located if I used one to give the case more weight and stability on the operating table.

Hope this helps. Good luck!

Bill

Hi Mike,
you are welcome. :-)
With my ORION I tested the "old" TT mod. 701 hand mike, an "old" TT electret mod.706, the dedicated Heil-built StudioOne, and the newer mod. 708 and 709 TT mikes.
I suggest you to use TT mod. 708 and 709 mikes, they sound great with me, and are my first choice.
The Heil Studio One is just as good, but please remember to check its well-known cable-wiring issue...
The 706 is also rather good, but it comes third in my list.
The 701 hand mike cannot reach the quality of the other mikes, but it is still a good element.

I did not test the new 702/703 hand mikes.

As about audio settings with ORION I, it is very easy using the dedicated 708/709 mikes: SP pot to zero, mic gain pot to 7.
I set my bandwidth to 3000 Hz for a wide audio, no more, and roll-off to 100 Hz.

Have fun with these great radios !
Fabio, I0LBE

There is no known firmware for the Orion, except what TenTec provides.
There would be considerable problems rolling your own without any
documentation or support from TT, even for programming experts. (Not
to say it's impossible!)

You can choose the latest version 2 release (which I use successfully)
or any of the earlier versions. They are all available from sources
on the net.

I contacted Ten-Tec and confirmed this is *NOT* true.

Please confirm your sources before posting nonsense as
just because one "read it on the net" does not mean it
is anywhere close to being accurate or the truth. <sigh>

Why one posts such and then states "Do not quot me
on that for sure" ... is rather amazing.

"I believe it ..."
"I know I read ..."
"I was talking to ..."
"So I have been told ..."
"Do not quot me on that for sure ..."

Pure nonsense ... come on Ed, you would not want
someone to post such about YOU on a public forum,
so why did you do such about Ten-Tec?

They deserve better ...

Topic: 5368 Message: 5368

Greetings,

I my quest for answers I have documented what I have observed and I hope it can be of help for others as well I hope to receive (constructive) feedback on its content.

Through analysis I learned that using Threshold can lead to about 20dB out of band noise reduction compared to using RF Gain setting to control the IF gain. This is significant and I have tried to visualize this behavior and uploaded it to the files section.

My two cents, hope its worth something for someone ;-)

Best regards, Onno pa1ap

If you are using the 705 mic with the 4 pin connector, the negative mic return is connected to the same pin as the shield ground. I use a 4 pin setup on my Argo V as well as my Jupiter. I use a different setup on my Orion II with the 8 pin connector which I detailed on this forum a few days ago. Good luck!

Onno,

I am not sure I entirely understand what your report is saying but from what I think I understand you are saying, increasing the threshold or reducing the RF gain, the out of band noise is reduced by 10 to 20 dB.

I can't see why this would explain the dramatic improvement in S/N ratio reported by those who use the effect. The out of band noise is already well down in level.

You provide two charts which show the output spectrum of morse code signals at S8-9 level with the RF gain reduced and the threshold increased. What would be interesting would be to see the same charts with these S8-9 signals but with the threshold left at default and the RF gain at full on. What would be interesting to see is the supposed change in relative signal to in band noise for two set ups (i.e. RF gain at full/threshold at default compared to RF gain reduced/elevated threshold).

What was also interesting was the difference in the shape of the output characteristic between the default threshold case and the threshold set above band noise case (the first two charts). Do you have any explanation for the tailing off in the output characteristic after 3kHz for the default threshold case compared to the sharp cut off in the elevated threshold characteristic?

I hope I haven't misunderstood your report.

Best,

Henry.

Greetings Henry,

Thanks very much for reply and comments!

I have to find a way to capture the same screen when a strong signal arrives. What i have already observed is that the out of band noise jumps up to about 20dB below the in band noise. This with threshold below band noise. When setting threshold little above in band noise the difference would be about 30-40dB and this can be heard clearly.

From what I found the AGC characterists cause significant out of band noise. Its almost at the same level as the inband noise figure. You will definitely hear this through the speaker, even in 1372 firmware.

I will run the same test with other firmware. If i am not mistaken using 2056 shows much better behavior on the out of band noise.

Have to go to work but will continue later today.

Thanks so much for your feedback, I will try to figure out possible answers.

Best regards, Onno pa1ap

This week I will compare with 2056 firmware which does not cause out of band noise as found with other firmware (illustration#5 clearly shows artifacts in the out of band spectrum using 1372). 2056 is cleaner then 1372 firmware and the sound produced has better quality in my humble opinion.

What I observe in 1372 & 2063Xg firmware is that medium to strong signals cause strong artifacts in the outband spectrum. The difference in volume between in & out band noise is anywhere between 10 to 20dB and for sure you will "hear" this. The artifacts are often short duration and hence they might translate in "clicking" sounds and they will reach your ears through the speaker. I have to find a way to show / capture minimum, average and peak volume on both in and out band noise...

Maybe I am using the orion wrong, i am only human and trying to do my best to understand the settings. Any suggestions very welcome.

Some thoughts;
Suppose the normal band noise as received on orion causes AGC clipping and this translates to out of band artifacts (just assume for now). Moving the threshold above the band noise would eliminate the AGC clipping effect and hence you see a much deeper "cliff" between inband and out of band noise. Sounds plausible to me and the audio pictures seem to confirm this...

Perhaps the question should be about removing noise instead of changing wanted signal to noise ratio....

Regardless of settings I have not found a way to improve signal to noise ratio with any setting when looking within the passband. If a signal is 20dB above the (in band) noise there is little to nothing which can improve this. Until you look further then the in band noise figure and include the out of band noise figure which generates noise as well (normal noise plus -unwanted- artifacts)....

Anyway, it is an exciting topic and I enjoy researching this despite the limited tools available.

I will try to provide A/B reports, as well see if I can isolate the out of band noise somehow to take it out of the equation. Perhaps I can have the audio going through an outside DSP low pass filter, make a recording and then run the audio through an outside DSP high pass filter to capture the out of and noise... Will see how and if I can build such test setup. Easy step might be to use the build-in RX equalizer to give the high / low frequencies a 20dB boost / attenuation although its provided by the same DSP driving the AGC...

Best regards,
Onno, pa1ap

Quickly capture difference between 1372 and 2056 regarding out of band noise.

Open the document and you will find three slides.

Slide 1 & 2 cover 1372 fw:

the red line shows the peak signal and the green line is the lowest level.

You can clearly see that using threshold below band noise sets the outband noise at about 20dB below the in band noise.

Second slide I have put threshold just above the band noise and you see a significant drop of the minimum out of band noise and the upper out of band noise.

For both slides you see clearly that out of band noise is really there... I dont know what the out of band noise represents, could be clipping, harmonics, artifacts... dont know.

Slide 3 covers 2056 fw;

the red line shows the peak signal and the green line is the lowest level. This is the same qso and i have set the threshold just above the band noise.... Two observations; for one there is no strange noise present in out of band spectrum. Second when the stations talks the out of band noise does not change. As you can see with slide 1 and 2 the out of band noise moves up the peak line (red)...

What this means in practise? To me listnening to signals using 2056 sounds much more relaxing and cleaner then 1372. If i use 2063Xg the distortion in oit of band spectrum is even worse then 1372....

Anyway, just an observation and perhaps i am overlooking something. Please comment and share idea's on how this could be tested in a better way...

Thanks and best regards,
Onno pa1ap

Hello Henry,

Here is what I found;

Out of band noise is not well down in level unfortunately. It is only 20dB below band noise and hence it adds to the total sound coming out of the speaker.

Second when there is a stronger signal in the pass band somehow the out of band spectrum gets populated by strange signals, which are not well below band noise....

Setting the threshold above band noise lowers the out of band noise but it gets modulated by the strange ghost signals.

/// above all with 1372 and actually 2063Xg beta as well

Now if you install another firmware (2056) the results are really different. No more strange signals in the out of band spectrum... And yes you can clearly hear that difference.

////

For me the questions are;
1) what causes this out of band noise to be so present? Is it caused by wrong / invalid settings or firmware behavior?
2) its even worse when you run cw while using 1372... Then you see ghost signals in the out of band spectrum... in other words the dsp duplicates the signal multiple times.... could this be related to the artifacts we see when using other modes? I will share a picture to demonstrate this.
3) 2056 dsp routine confirms this out of band noise & ghost signals do not have to be present
4) setting threshold can significantly reduce out of band noise and I am wondering this is what has been observed in the past by other operators fiddling with threshold values to raise margins signals out of the noise coming out of the speaker....

Best regards, Onno pa1ap

Related to 2063Xg RF GAIN to demonstrate the out of band noise contribution (clipping, artifacts or whatever we call them)... Very similar to 1372 out of band noise.

To demonstrate the contribution of out of band noise (regardless of what causing it to happen) I have captured a QSO on 20 meter between a very strong Italian station and weak Canadian station. Its available as mp3 within the files section.

Then I run the capture through a dsp program and applied a 3Khz low pass filter on the audio at the following time intervals; between 5-10 seconds, 30-40 seconds, 55-60 seconds, 65-70 seconds... The recording is a little longer then 70 seconds, so it should not take that much time to go through it.

Here is what funny about this whole thing. We all assume the out of band noise is way below the wanted signal, hence we don't hear it... I believe what I demonstrate with this simple trick is what happens to the audio when you remove the frequencies above 3Khz.... you can really hear the difference...

When i do the same test with 2056 I can not detect any difference. With 1372 the difference is smaller but present...

Appreciate feedback and advice!

Best regards, Onno pa1ap

And if you like to see the difference being visualized in the same way i have done before, please check the picture i have posted.

I have taken the recording and run it through the analysis program... You can clearly see when the 3Khz LP is enabled and when it is not.

Out of band noise does translate in additional "noise" which is captured by our ears... For me it is proven now but perhaps I am overlooking something.

Best regards, Onno pa1ap

From: ko4xj
Topic: 5381 Message: 5381

Over the last week seems like I have been having a few problems starting to develop on my O1..running 2.063Xg

1. When I turn the rig on no matter what band it comes on to, it's like the there is no antenna connected. Nothing on the sweep. If I change bands and come back to the first band, it's good then. This problem has been here a few months. The TT guys at Dayton said it could be band relay or something like that, but possibly a relay sticking. I can live with that until it get worse

These are more recent problems in the last week,

2. When the rig has been off for some hours and turn it on the screen is real dark (white background/black text) and then it gets brighter over a 1 minute or 2 to where I have the setting to. At the angle of the rig for my viewing pleasure the contrast is at 35% but this dark screen turning light just started. POSSIBLE VOLTAGE ISSUE?? will check tomorrow

3. Randomly when I press the RFGAIN button the value setting disappears, and if I press another button around the screen, the RFGAIN setting still is invisiable. If I change bands it may come back or turn the rig off it will come back. The RFGAIN still works but just no indication of the setting

4. Also I can enter a menu setting (does not matter which one) and there are random display glitches. Sometimes the value of a setting will still be displayed from the previous screen or a black block will be on the screen where it should not be.

Now I'm wondering, is this a connection problem for the monitor where I need to reseat a board or is this a more $$$ issue developing.

I also have done BATTERY FAIL reset and reloaded the 2.063Xg with the same issues, I have not gone back to another version since all has been ok since the release date of 2.063 until last week

There seems to be no operational issue other than the video problems, as far as I can tell.

ALSO I suffer from the RIT/XIT issues also and that's what makes me wonder if it's bad connections somewhere behind the front panel (you know press on the edge to make the RIT work)

Thanks

John

I have always wondered if this was true. I have noticed the "out of band noise" earlier but attributed it to maybe a noisy audio PA or circuitry after the DSP. Never thought it could come from the DSP itself. To me it seems best noticeable when I use headphones. In order to diminuate it I used to turn down a bit the volume knob provided on the headphones cord and turn louder the volume knob on the radio in order to reach the same AF level. Don't know about you, but to me it seemed to make a lot of difference. Maybe it was just my ears hearing it that way.

You could try the RX eq setting and use it as low pass filter. No harm trying and perhaps it gives you the difference you are looking for. I am not sure how turning down volume on headset and turning up volume in orion would reduce the out of band noise.

From what i remember the headphone connection has a modification to increase the impedance by a hundred ohm or so to illimate hiss as detected by some folks with the first batch of orions. when connecting a low impedance headset the noise was significant.

Perhaps try the RX EQ setting and see what this does for you.

Best regards, Onno pa1ap

Well I am not sure either. It always seemed to me as the noise was a constant high pitched broadband (say 5-15 kHz) noise of a later AF stage and that I could improve the signal to noise ratio by increasing the useful signal before the amplifier and attenuating afterwards both the signal and the noise, hence resulting in an improvement in signal to noise ratio.

It also might still be that I am in fact not talking about the noise you got to but about the hiss issue with low impedance headphones, of which I did not know. I am also not aware about the increased impedance modification, will look around for it.

thanks,

Dan, yo2llq

5387. RE: [orion565] developing problems?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-07-15 12:37:54 UTC
From: John T. Fleming
Topic: 5381 Message: 5387

John,

Behind the row of buttons on the right hand side of the display is a series of long pins that plug into the sockets for the pins and the sockets are mounted on the back side of the buttons. I have found that they can oxidize over time. Press the edge of the window frame between the display and buttons and that will exercise the connections and should fix the RIT/XIT problem. A longer lasting but not easier approach is to download the V2 mod instructions. I will tell you how to take the front panel apart. From my experience, just loosen the screws holding the circuit boards behind the display panel and put contact cleaner on ALL of the plug in connections and then "exercise" the connection and tighten everything up again. Then re-assemble the front panel. The directions are near the end of the V2 mod instructions. This should hold you for a few years. I should also help the display problem.

73,

John

5388. 2063 Xg out of band distortion, recording and visualized

Yahoo group: orion565 (2009 — 2013)
Date: 2009-07-20 18:29:35 UTC
From: pa1ap
Topic: 5388 Message: 5388

Greetings,

I have uploaded short recordings (MP3 high quality) as well visual picture of the recording showing amplitude related to frequency over the period of the recording.

If you hear the recording, it will start with original sound and after a few seconds I apply a low pass filter (dsp) at 3Khz... This way the out of band noise/ artifacts / distortion or whatever you like to call it is removed. I hear the distortion through speaker and headset, where the headset works best.

If you look at the recording (the two picture files with png extention) you can clearly see when the low pass at 3Khz is enabled or not... meanwhile if you hear the recordings you will notice the absence of this out of band noise.

I personally hope Ten-tec will address this issue. It is unwanted noise and clearly detectable. And I know this does not have to be the case since some firmware versions do not have this issue and the out of band noise is really

files folder: pa1ap firmware comments & findings and look for 2063Xg strong / weak signal...

Best regards,

Onno pa1ap

Have you sent this information directly to Ten-Tec? As far as I know
Ten-Tec does not monitor this list. They do post the Used/Demo list on
the contesting.com Ten-Tec list but I don't know if they monitor the
traffic on that list either.

5391. O1 Power issue

Yahoo group: orion565 (2009 — 2013)
Date: 2009-07-21 01:50:30 UTC
From: ko4xj
Topic: 5391 Message: 5391

Well something happened!

A few months ago I asked about the power switch or a software glitch, sometimes the radio would not turn off at the switch so I had to turn off the power supply then when powered up, the switch would work fine. Some of you replied and said they had to replace their power switch so OK I'll chage out the switch. Well it seemed to work for sometime until this weekend while trying to work the NAQP RTTY.

All of a sudden I could not get 100 watts out, then the screen was doing some funny things, like when I powered on the screen it would take 30-45 seconds to "warm up." It was blank then you could see the text on the display

I had a reply about pulling the display board out and making sure the connectors are seated good and clean the contacts, I did that today and when I put it back on line the same thing with the display. BUT now the when I hit the tune button the radio does a power reset. Each time I go to transmit, BAM the radio shuts off then powers up. I've even changed power supplies, a 35amp and a 50amp same thing.

Just now it reset and now it will not power up. FUSE IS GOOD CHECKED IT! and the 2m is on so power supply is working

I've been meaning to change the power switch for a few months so tomorrow I'm back to pulling the front off and checking the voltage thru the switch

COULD THE SWITCH NOT BE CARRYING ENOUGH VOLTAGE TO CARRY THE RADIOAND SHUT DOWN DURING TX? Or is this rig headed to Sevierville?

Thanks for any help or advice

Yes ... as the same board in used on both the 565 and 566.

Here's another web site with more details on the replacement caps:

http://www.users.qwest.net/~pfizenmayer/Orion%20565%20and%20Orion%20II%20566%20Capacitor%20Failures%20in%2081936%20board.htm

Before you change the caps on the power distribution board, take a quick look at the power connectors on the back of the radio.

Over time, the pins can spread and lose contact as the power cable is moved or flexed. That can cause the power down and reboot symptom you're seeing on transmit. It happened to me. When I looked closely at the connectors, I could see some brown areas where the connectors had lost full contact and the resistance had heated the plastic.

That particular problem may not have caused some of the other symptoms you're seeing, and bad caps on the power distribution board are another likely candidate. but it's certainly worth a quick look at the power connectors. You might have two problems!

5398. Question regarding the 2.041XT Beta upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2009-07-21 19:34:47 UTC
From: k1fpv
Topic: 5398 Message: 5398

I remember reading on this forum that many guys were having troubles with the Beta Firmware 2-041XT turning the screen red and a couple other issues. Are they still occurring or has Ten-Tec modified it. I'm toying with the idea of upgrading mine from 2.039d. Any comments?

Thanks & 73,
Bill

Related to the "red screen" ... try setting the RF GAIN to
60 and see if it happens, then try 61 or higher and compare.

Next I will try the above with and without the PREAMP ON,
and compare those results to confirm what I am seeing here.

So far a setting of 60 or lower does not create the 'red screen'.

Well, looks like my Orion II is going back on the bench. A few moments ago, I tried to fire it up and noticed it acting weird. When it first boots up, it appears to receive OK. When I touch the VFO dial to change frequency, the RX seems to go numb. Also, it won't transmit. I'm willing to bet that it might be more caps on the power distribution board. I had problems when it was just over 1 year old with bad caps there causing weird things.

Anyone else have this similar problem?

Bill

Bill I'm waiting on the caps from TT to get here as I type this.. my O1 started with power switch was randomly not shutting the rig down, had to turn the PS off. Then the display started acting up, graphics from 1 menu screen would carry to another screen, then the display would be blank at power up and then the text would SLOWLY appear (30-45 seconds), THEN the rig would not tx 100watts and it would shut down and reboot every time I transmitted THEN finally it would not power up at all.other than the power switch, all those symptoms happened within the last 1-2 weeks before shutting down. Found out about the PDB caps from Hank K7HP and Ron K6IE info and C6 is bulging like their descriptions and now I'm waiting to replace the caps..

Good luck and I hope mine is just the caps!!

Hi John,

Well I'm guessing that I have more caps bad on mine. When the radio was a little over 1 year old, I had an intermittent problem with it similar to yours, even though mine is an Orion II. When I put it on the bench, the +5 volt line had lots of garbage on it when I looked at it with my scope. My ESR meter confirmed the cap was bad. While I was there I saw a couple other caps bulging a bit so I replaced them. I replaced them with caps of equal value, equal voltage rating and temp. ratings of 105°c. A couple of the caps were 85 degree caps.

I'm just finishing up stabilizing a 430MHz. amp for my ATV setup and then will be putting the Orion II on the bench. I'll keep ya posted how things work out.

73,
Bill

5404. Orion I - LCD flicker and audio bubbles

Yahoo group: orion565 (2009 — 2013)
Date: 2009-07-25 05:27:14 UTC
From: it9yhr
Topic: 5404 Message: 5404

Hi, I have an Orion I from about 2 week and I have two question:

1) I have noted that in the first minutes of warmup the audio bubbles, after than this problem disappear.

2) The LCd screen during software loading flicker, after than became fixed without any problem.

Are this problem normal ? Is a characteristic of the Orion or is it a defect of my rig ?

many thanks.

Alex IT9YHR

Greetings,

Which firmware are you running right now? To check press the menu button for 5 seconds or so while the rig is working... You should see the firmware number in the screen then. The LCD control routine is a bit different for some versions. If you share I can up/downgrade my unit and report back on what I see.

On the audio bubble issue... No I have not seen that before. Perhaps there are others who can advice. Sounds to me as if you have a electic capacitor which is leaking and hence it takes more time to bring it up to spec... Send an email to ten-tec, they might be able to advice.

Best regards,
Onno pa1ap

This has been niggling me for a while but I'm finally gonna ask.

I have an O1 v1.372

My S-meter on receive sits permanently on S1 with no signal on RX (RF Gain is at max). Surely it should sit at zero?

Dear Onno,

many thanks for very interesting info, my firmware version is 2.062a.

About bubbles, yes I think too, will be a capacitor problem. I write
to tentec technical service.

I will report you what information will give me.

Many thanks,

Alex IT9YHR

Hello Alex,

Most likely the contrast potentiometer is still set to match the release 1 firmware setting. When you are running the orion do you adjust the contrast through the menu? And if so, is it different from 50% (default) setting?

Here is what I noticed; during the boot sequence the contrast is starting at 50% (default) and then reverts to whatever value you have set in the menu. In case the contrast setting in the menu is for example 65% to achieve a good sharp image you will see during boot sequence the following; Switch on, darker screen, system loading, then a blink and orion is operational at lighter screen.

In case you are tuning the contrast through the menu to something else then 50% I would recommend you to adjust the contrast potentiometer. The contrast potentiometer is below the VFO A dial and can be reached through small hole at the bottom. Carefully adjust the contrast without pushing to hard against the potentiometer. If you push to hard you break it and you have to replace the potentiometer (that happend to me....)

Contrast should be set after warm-up of 20 minutes or so. menu setting should be a 50% and then you adjust for perfect image. After that the boot sequence should remain (almost) equal.

Let me know how this goes. p.s. for excellent sound try 2.056 firmware.

Best regards,
Onno

Fine, I have adjust the trimmer, much better now, but a little flicker
for few seconds still remain, but it is not a great problem, only two
second and then the image is perfect also during the sturtup.

Before the trimmer adjustment, the menu contrast was 58 %, now 50 %
all the time.

Believe this is normal Alex. Right after power on I see the contrast modulating the screen for 1 or 2 seconds. Then it goes in stable mode and continues to boot the system.

enjoy the rig, best regards, Onno pa1ap

Yes the same ... the contrast modulating the screen for about two
second, so I think that is normal.

Many thanks in did for all information and assistence (in real time).

The radio is very good in did ! And I am very happy for this new rig.

Now i put off all my station and I go to the sea for some days. The
temperature in Sicily are anormal up 40 ° !

Have a nice summer.

Ciao Alex IT9YHR

PS where I can download the 2.056 firmware version ?

Subject: [orion565] S Meter

This has been niggling me for a while but I'm finally gonna ask.

I have an O1 v1.372

My S-meter on receive sits permanently on S1 with no signal on RX (RF Gain is at max). Surely it should sit at zero?

Greetings,

Working split is great until you realize the mode is different on the second receiver.

I wonder if you can comment on the following feature request I would like to share with ten-tec;

after pushing the "mode" button, followed by A>B, the "mode" setting of A gets copied to B.... B>a does the reverse.

Now include bandwidth as well and you would be ready to go.

Any comments, advice?

Thanks and best regards, Onno pa1ap

Onno,
I think by your explaination that you're trying to change the mode, BW, etc; in the sub band or B VFO.. You should be able to do that quickly by pushing the sub button above and between the 2 vfo tuning knobs and then changing the mode, BW, etc; on the B VFO..

Yes indeed and agreed what you describe is one way of doing it.

Push VFO B, push mode, push LSB, turn BW encoder and push VFO A again. Each step with some patience due to control respons time.

Or

Push Mode, push A>B. Done. Kind of a shortcut.

To me it would be a worthwhile enhancement.

Best regards, Onno pa1ap

I'd settle for A>B transferring ALL the settings from A to B rather than
just the frequency.

The original request included optional transfer of mode/BW/AGC/PBT and
the request was made several times throughout 2004.

Given the Orion's need for a supply voltage in excess of 12V, does anyone have any cunning method of powering the radio for the field using batteries?

I concede that I have asked this question before, but in a slightly different way!

Rob, most batteries and 12VDC supplies run at 13.8VDC. Getting down to 12V on a battery means it is nearing depletion. The Orion should run fine on batteries as long as the current reserve is sufficient.

Hi Andrew

Gel batteries are 12V or possibly a little more (I have held some up to a charge of 12.5V), but nowhere near 13.8 (or even the 12.8 minimum that the Orion needs). Yes, AC powered DC supplies are indeed 13.8V. 12V batteries charge at 13.8V but a standard Lead/Acid cell is 1.5v and a 12V battery "pack" is simply 8 in series.

Now, if someone made a sealed lead/acid with 9 cells I'd be happy.

Rob,

I don't know if you can get them or not, but I live in a golf cart community. (78,000 people and 20,000 golf carts.) Many of the carts use 8 volt batteries. It would give you 16 volts. I am not home now to look at the specs for the Orion, but 16 volts may be useable.

73,

John

Thanks John

The specs state "12.8 to 15v"

:-((

I could always feed the Orion with a 100 foot cable. Expect I'd lose about
1v !!

Rob,

Use a 6 and an 8 volt battery. But then you would need to different chargers. :-{

73,

John

Thanks John

The specs state "12.8 to 15v"

:-((

I could always feed the Orion with a 100 foot cable. Expect I'd lose about 1v !!

Thats also an interesting idea. Whenever you push A>B you copy the whole lot. In essence RX B becomes a clone. The only draw back is that you can not choose to do so, it will always happen.

With the 2 step/button approach one can choose.

Button A>B = just frequency.
Button mode, button A>B = clone RX A to RX B [agc, bw, passband etc]

I will send a request to ten-tec. Lets see!

best regards,
Onno

From: k1fpv
Topic: 5401 Message: 5433

Hi Matt,

Well, I just heard from Ten-Tec and they are now using special low ESR caps for C6 & C7. With that board being where it is, I bet a lot of problems of bad caps may be due to heat buildup. I often turn my Orion II on in the morning and turn it off at night. I operate at various times during the day over a span of roughly 12 hours.

So far I can't complain with any of my Ten-Tec equipment. The only other Ten-Tec rig of mine I've had to fix is my 526 (6N2). It had an intermittent trimmer on the synthesizer board. I've also got a Jupiter, Argo V, and just bought a used Omni VII. I also have a 238B tuner and the new speech processor. Only complain on the speech processor is I wish the Pass Band could go a little lower in frequency. But, I really can't complain as I get good reports with it.

73,
Bill

Hey Bill:
Thanks for the reply Bill. The A9 replacement went well. The caps on the new board are twice as large as the caps on the old board.
The fix was simple. The hardest part was finding a #10 torx driver in my tool box. The fix took twenty minutes or so. The cost of the board was $48.25 shipped. I do have a 2nd class radio telephone license , but I fill if a person has the ability to unscrew 14 screws and plug a lamp into a wall socket , they can replace an A9 board.
I'm still planning to recap the old board , just to do it.

Matt I just replaced the caps last week on the A9 & other than the torx getting the solder hot enough to use the solder wick so the holes would be clean was the most time consuming and that was not too long 30 more minutes

Glad its working

Matt, I have to laugh at the 2nd class FCC license. It's worth (almost) the paper it's printed on. When the FCC took away the license requirement on broadcast stations (and others) to have an FCC 1st class to be a Chief Engineer (CE) they really screwed everything up. I found my FCC 1st to be worthless !

What seems to work, if you are interested, is the Certified Electronic Technician (CET) license. You might want to read about it on the International Society of Certified Electronic Technician's (ISCET) website. I hold license #PA-291.

When I took the test it was equivalent to the old FCC first class where you actually had to draw circuits and insert or move components around to make the radio (or whatever) work.

The broadcast industry and others now recognize the CET paperwork.

Sam,

Brings back bad memories.
When I sent in my 1st Phone with Ships Radar endorsement
many years ago for renewal and received back that lousy little
"General Radio Telephone" I could have cried.
I got the 1st back in 1957 and held it for many years but, since
was not in Broadcasting any longer I didn't brother to get the CET
that was offered if we did it in a certain period of time as an exchange.
At lest I can say I "Held" a 1st for a long time.

Hey Guys:
I know the radio/telephone license is worthless now ,but it was just my way of saying... Hey ! I have a background in electronics, but if you can screw in a light bulb, you can replace an A9 board, you don't need any kind of electronic experience. That's all I was trying to say.
Heck, you can't even replace the wrong board , because there's only one board under there.

I never did renew the license,but it came in real handy during my thirty some years as an underground coalminer. Whenever something new would come in the mine,the managers picked me to test or operate the new & inovated equipment, be it electronic hearing protection ,four million dollar R&D tramvayer system or replacing boards & switches in the longwall control systems & wiring. In other words I did't use a pick & shovel much. Soooooo...it did come in handy.

Hi, something of anormal happen on my Orion I.

Infact often (2 3 time a day) when I power on my transceiver on the screen appear FLASH UPDATE MODE without pressing the relative button.

If I use the exit way the system crash and I must do the MASTER RESET.

Someone can help me. There is a battery backup failure ?

Waiting for an answer.

Well actually gentlemen, the former first class radiotelephone license is worth something to S.B.E. (Society of Broadcast Engineers) That is the organization who certifies most of us who had our 1st. Class Phone tickets. If someone renewed it as a General Radiophone ticket (when the 1st. Class Phone Ticket was discontinued, it was good for life.

The SBE grants that person the title of CBT (Certified Broadcast Technologist). Back in 1968 when I started in broadcasting, the 1st. Class Phone was mandatory and has to be renewed every 5 years. The CBT as well as CPBE (Certified Professional Broadcast Engineer) must be renewed every 5 years. There are sub categories too deal with too.
After retiring from a broadcasting career that began almost 40 years ago, I've pretty much seen it all! ;)

At any rate, on the original problem, my Orion II is working fine now. Ten-Tec sent me a couple of the low ESR caps for C6 & C7 on the power board and I bought some spares from Mouser in case it happens again. While I was at it, I replaced C9 which is the same value. These caps are rated to 105°C and not 85 degrees like the originals.

Have a good one guys,

Bill, K1FPV, CPBE (Technically it ran out in January since I retired in 2005.)

5445. Orion drivers and finals

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-05 11:16:18 UTC
From: Jose V. Gavila
Topic: 5445 Message: 5445

Hello!

I am working on an Orion which has a damaged Power Amplifier. It has bad drivers (2SC3133) and bad finals (2SC2290). I have found that RF-Parts has the finals as a MP (matched pair) available but they have not drivers (they show the 2SC1945 as a substitute but, again, there are not MP available)

I have sent an e-mail directly to Ten-Tec but I wonder if someone has already replaced the drivers and what was used to replace them.

Thanks!

5447. Ten Tec Orion ii with Ten Tec Centurion amplifier and automatic antenna tuner

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-08 19:44:23 UTC
From: tompinkus
Topic: 5447 Message: 5447

Hi, I was just watching Ten Tec TV on how to tune the Centurion amplifier. I have a Century 21 and an Orion II and I am considering purchasing a Centurion amplifier.

I plan to use an automatic antenna tuner with the amplifier as I have G5RV antennas. In real life, does the input 50 ohm impedance that the antenna tuner presents to the Centurion stay fairly constant at 50 Ohms? For instance, once I tune the amplifier for a particular frequency in a ham band, will the auto tuner allow me to QSY across the band without me having to readjust the controls on the Centurion?

Otherwise how broad-banded is the tuning of the Centurion? Buying a solid state amplifier is also an option for me. I have never owned a HF amplifier and I am a OT operator but with the band conditions as they are I am thinking about getting one.

Does the Centurion have much of a history of changes in the circuit design? Are all serial #s the same except for the color of the cabinet?

Tom,
I just got and Orion II and have a 4 year old Centurion. This amp puts out over 1000 watts so whatever automatic tuner you use has to be able to handle this power. Once the Centurion is tuned to 50 ohms out for a particular band, it does not need to be retuned, only the autotuner needs to be retuned if you stray far from where you started on the band.
There was a minor fix early on for the qsk I believe. Other than that the amp is the same as the original except the transformer is not made in house any more and as you noted, the front color is different. This amp has not given me any trouble in the 4 years that I have owned it and I use it with the tentec manual hi power tuner.

Huh? You may want to rethink this...

Tank circuit tuning is frequency dependant.
e.g. if you change frequency you have to retune the amplifier
to resonance at the new frequency even if in the same band...

Good luck!

From: n9aop2000
Topic: 5448 Message: 5450

I guess I should have been more precise. On 20 meters and up, once the amp is tuned, it is good for the whole band provided the impedance stays constant. On 40 meters you will have to touch up the amp tuning if you go from the CW to the SSB part of the band. On 80 meters, the band is so wide that you need to retune about 4 times going from 3.5 to 4.0. I operate mostly on 20 and up and didn't think much about 40 and 80 when I answered your post.

From: adb1x1
Topic: 5451 Message: 5451

I am new to the list and new to an Orion 1.

Seems this one has an issue with the encoder for PB/BW adjustment (skips, works sometimes, sometimes values just bobble when turning the control). Since it is a mechanical encoder, I suspect the contacts are just worn and not making always as they should.

Some research has led me to conclude this is a common failure (well, maybe "well known" is a better description)

I plan to replace it, but was wondering if anyone knows the manufacturer and part number? I would like to see if there is an equivalent that has longer mechanical life.

Might just change them all if there is. Keeps me from having to take it apart more than once.

Thank you!
Anthony, NT4X

Anthony,

it is not mechanical device. There are no contacts. The replacement part can be ordered directly at Ten-Tec and is cheap, I paid less than $4 for each. The change is quite painful.

The encoder is very reliable, there is quite low probability to find a defective one. I recommend to check contacts of pin arrays widely used in the control boards (use a magnifier and look VERY carefully).

Martin,
Thank you for the reply.

By mechanical, I mean the technology used in the encoder design. Optical encoders use phototransistors, leds and a mask. Mechanical encoders are made kind of like potentiometers: They have a pattern of contacts and a wiper that makes physical contact. They typically have less longivity than optical encoders for obvious reasons. Since I have seen several postings on other mailing lists about problems with the encoder (esp the RIT encoder), I am wanting to check the specs on the one used by Ten Tec and see what might have a greater mechanical lifespan.

Thank you!
Anthony

From: kd6hq
Topic: 5454 Message: 5454

Hello

Well I decided to try a 302 remote pod so I purchased a used one (a possible mistake).

Anyway when I plug in the 302 I loose all function of the front panel. None of the front panel controls work until I unplug the 302 then everything returns to normal. Also the VFO of the 302 works but none of the other function keys on the 302 seem to have any affect.

I checked the menu and all are set to the default settings.

Any one else have this problem?

Thanks

Don

Hello Don.

I don't have the 302 but if you feel like taking a trip down to San Jose

you can try it out on my O1.

Here is a TT youtube demo, albiet it's for an O2, maybe you can gleam
something from it.

<http://www.youtube.com/watch?v=FhhfDK8j1zI>

I'd be interested your resolution.

Good luck

From: k3sam
Topic: 5458 Message: 5458

This is the 2nd major problem with my Orion II since I purchased it less than a year ago. For the sake of getting a quick answer back I'm not going to mention the first problem.

Does anyone have any information on (or have you experienced) why my Orion II might have died. No display, no audio, no nothing except for a "thud" in the audio when switch the power to ON, after that no audio.

Without getting into the schematics as this just happened a few minutes ago, it is my "guess" that there's probably several regulators within the radio. Probably one for 5VDC and most likely one for 12VDC. Most likely this problem is due to one of those voltage regulators dying. The external power supply is good, tested and currently being used with my 2 meter rig too (Astron 50 Amp 12 VDC, both adjustable - VS50M).

This type of problem should be fairly easy to find and fix as it's not intermittent in nature. This radio will NOT turn on, period... so tracing back the voltage loss (if that's what it is) should be easy if I can find the schematics on the TT website (geesh, should have come with the radio).

Hey, time to start disconnecting EVERYTHING so I can get to the radio, Thanks in advance!

Fernando and Chris

Thanks for the replies, and no it's not plugged into the Aux. Jack ☐ my navigator is ☐ so I know it's not that. I have a feeling that it is the 302 or perhaps the connecting wire.
In any case I will post what I find here.

Fernando, thank you for the invitation to use your Orion but like you said it is somewhat of a trip. I also watched the youtube demo and it makes me think that it is the 302.

I also sent Ten Tec a note and will let you know what they say and what it turns out to be.

Hi Sam,
Yes, on the A9 power distribution board, C6 & C7 are 470µf capacitors rated at 16VDC are known for problems. I've had to replace mine twice. This last time, I replaced them with Low ESR caps rated at 35VDC and rated for a temp of 105 degrees C. While at it, I also replaced C9 as it was the same make and type cap.

The board is located on the under side of the chassis. It is board # 81936. Apparently, this is a common problem with the Orion and Orion II. Incidentally, Ten-Tec recommends replacing them with low ESR caps and is now using them in their production of the Orion II.

These caps cause a multitude of problems. My Orion II gave me different problems each time the caps went. The first time, I didn't replace them with low ESR caps and thus a year and a half later, a new problem occurred. I'm pretty sure that will be your problem. Good luck!

73,
Bill

Subject: [orion565] Re: Dead Orion II

Hi Sam,
Yes, on the A9 power distribution board, C6 & C7 are 470µf capacitors rated at 16VDC are known for problems. I've had to replace mine twice. This last time, I replaced them with Low ESR caps rated at 35VDC and rated for a temp of 105 degrees C. While at it, I also replaced C9 as it was the same make and type cap.

The board is located on the under side of the chassis. It is board # 81936. Apparently, this is a common problem with the Orion and Orion II. Incidentally, Ten-Tec recommends replacing them with low ESR caps and is now using them in their production of the Orion II.

These caps cause a multitude of problems. My Orion II gave me different problems each time the caps went. The first time, I didn't replace them with low ESR caps and thus a year and a half later, a new problem occurred. I'm pretty sure that will be your problem. Good luck!

73,
Bill
K1FPV

Fernando

Well the 302R is back up and working. I opened the 302 up and it is a very simple device. Bunch of keys, 2 caps, 2 resistor packs, 3 IC's. 2 of the IC's are line encoders MM74HC148N and the other is a "Quad 2-Input NAND Gate MC74HC00N. It turned out to be one or both of the line encoders. I just replaced them both at once. Cost of repair, whatever gas I used to go to the local electronics store and $2.75 in parts, oh yes and a little time.

So now that I have the 302R & computer controlled radio I don't have to touch anything except to turn it on. Especially nice since everything is rack mounted.

From: Tony Sokol
Topic: 5467 Message: 5467

Hi Gang,

I am new to the list and probably missed a lot of discussion on this topic but thought I would check with those that have ''been there...done that." I recently acquired a really nice Orion II and the former owner had installed Version 2.041XL which I do realize is a Beta program. Well, I had the "red screen" which I assume refers to the sweep trying to mix the spectrum and waterfall functions resulting in that part of the screen turning red and displaying both.

I installed Version 2.041XT (still a beta) and although it has gotten better, it still has the same problem. If I turn the rig off and let it reboot, the problem goes away...for a while. Sooooo....what is the preferred version? I am guessing 2.039d but am curious what others have found and reverted back to if, in fact, they did go back a version or two.

Incidentally, I also have the Omni VII which I have had since the beginning and am really torn between the two! They are BOTH really great...no, outstanding rigs. I just could not resist the opportunity to try out the Orion while I had the chance.

Thanks
73
Tony - W9JXN

Tony, no need to turn the rig on/off, just switch the SWEEP on/off.

I am running the latest beta here ... with few problems as noted.

Hi Billy,

I did that and it works for a while but comes back rather quickly.
Turning the rig off and on seems to keep it working for a much longer
period although that may be just my perception.

Hi Tony,

Try setting your RF GAIN to 60%, and see if the "red out" stops.

I believe that's the threshold I found here from doing some testing.

5472. VOX hangup

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-18 13:56:21 UTC
From: Andrew B. Steen
Topic: 5472 Message: 5472

Good morning all. I recently started having a problem with the VOX hanging up on me. I have had my Orion II for about a year and a half now (bought new). I am running the newest beta software. I have tried changing the various VOX settings, but it still hangs up on occaision. I am wondering if changing the mic did it. I was running the TenTec 708, and no problems, but I am now running the Heil PR-30 on a boom. Anyone else experienced this issue? I talked to TenTec (Paul), and he was unaware of this problem. His suggestions of master reset, and changing the VOX settings did not solve the problem.

Hello Andrew,

Since the last Beta Upgrade I have the same VOX problem.
Strange that nobody else is complaining for this issue

Hopefully it will be fixed in the final release, but WHEN....

At the end I'm losing confidence in TEN-TEC

Andrew,

Did you try the "Battery failure" reset? Turn on your rig while holding the VFOB LCK button until you see "Battery Failure." That erases any residual data in memory and totally reloads the rig from the ROM. The screen may have some garbage on it. Power down and power up the 565 again.

73,

John

Hi Andrew,

I am pretty sure the VOX issue IS related to the beta software.

Load the last pre-beta and see if the problem goes away.

And if so, then PLEASE email ditsnbits and confirm that there
is an error.

Hope this helps!

It is really too bad Ten-Tec isn't as dedicated to
improving their software as Elecraft is. If they were
there is no doubt they would be #1. In my view they have the
best hardware--- too bad I can't say the same about their software.

and replace the front knobs with some quality ones.
My ICOM 756pro feels like it was built to MilSpecs, but is noisy as all get out. The ORION II is nice and quiet, but feels like something Radio Shack would sell. Oh well, nobody's perfect... (I guess)

I will say that T*T's service, at least this time around has been spectacular ! Five star all the way.

improving their software as Elecraft is. If they were
there is no doubt they would be #1. In my view they have the
best hardware--- too bad I can't say the same about their software.

I have absolutely no gripes with my Orion II. I can get fairly quiet operation out of my PROIII and Orion II with proper NR settings and RF gain settings. I love the interaction of the NR and RF gain on the Orion II among several other things. I've had none of the vox issues. I probably love the Orion II QSK more than anything else. The more of the postings I read in these user groups, the more I'm convinced that a lot of the problems are due to the users unfamiliarity of their gear, and something exclusive to the transceiver in their station set up that may be awry that they cannot see.

Well-- I am very happy with my O II also. It is the best
transceiver I have had and I have been in this game since 1955.
It is just that Ten-Tec doesn't react to software problems with any
degree of urgency. When Elecraft is presented with a software
glitch they are on it and in a few days the problem is taken care of.
There are several things about the K-3 I do not like or I would
have one. For my money the O II is by far the best from an operational
stand point. and in general the receiver is outstanding.

5480. Re: VOX hangup

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-18 21:00:33 UTC
From: w3qj37
Topic: 5472 Message: 5480

I've worked in commercial and military electronics (design certification, and maintenance) for over 30 years. None of current ham gear is cutting edge by any means. It just isn't. The better DSP and firmware control of ham trancievers are trickling down some what to ham since technology and it's cost has come down over the years. The common consumer stuff is still bottom of the barrell compared to the military and commercial world. Folks complain about the cost and performance of the IC7800 and the like. Well, I doubt many would want to purchase something like the R&S XK2100.

I can't believe there isn't more open source in digital ham tranciever design. Who knows there may be. Seems like some of the whiners and complainers would start doing something about it like Wayne/Elecraft, and the folks at Flex. But there just isn't much money in this ham gear, so in that way I understand why there isn't more developement. It would be nice for Ten Tec to devote some more to the refining the 565/566 FW even further, but I bet it would be diminished return. Personally, I don't blame them. After spending many years in the commercial world, what I see in the ham world are lot of cheap complainers that would rather bitch and complain rather than trying to find a way to solve their problems on their own, and less, and less ops truly knowledgeable about electronics and radio sans the 60+years ops from the old school. Many of the new crowd can barely set up the most basic station, let alone repair their gear when it breaks.

And yes, the Elecraft K3.....without going into a longer diatribe than necssary, I have one only for portable ops, for an effective, spartan, power frugal CW station on crowded bands, it really shines. The K3 crowd on the other other reflector are a really thin skinned bunch. Hell, it seems like so many are so thinned skinned these days. You look at them the wrong way and they cry.

My long term dime is still with Ten Tec. I hope they make it through this economy. Even if they don't come up with new FW updates for the 566 anytime soon, I don't care. I'm happy with it as is. I'm either CW or phone, and mostly CW lately.

How do I recall the memory bank (200 memories). When I push the VFO>M button it just comes up with saving option, but how do I actually retrieve my memory to the VFO?

5484. RE: [orion565] Memory bank

Press VFOA>m or VOB>m and your VFO memory display is on the bottom of the display then use your MULTI knob to change memory locations

BTW, just what is the price for a R&S XK2100? I looked at their website and distributer list and didn't find any prices. Do you have an opinion about the Distronix DX2400L1 amplifier? Is it up to commercial and military specifications with a low price of approximately $11,000?

Ham radio is a hobby. I find the Orion ii works well just as it is even if the software never gets changed. I usually don't like to test beta software unless it might fix an existing problem that I just can't live with. I find almost zero problems with the working of the Orion ii.

Billy,

Tried that last night. Came down from 40 meters to check into the Collins net on 3805. A couple of minutes later with the RF gain waaay down due to tons of QRN and the attenuator kicked in, the dreaded "Red Screen" reared it's ugly head. It kept up until I shut the rig down completely and let it reboot. It worked perfectly the rest of the net.

One of the guys that is using an Orion II has not seen the problem. He is also using screen choice 4 instead of 3 which most of us are using. I don't know if hat has anything to do with it but I kind of like it a little better. It is doesn't appear overly busy with the toned down colors. I do think it would be a little nicer if the Main Receiver used the brighter green readout rather than the Sub receiver. Just an observation.

One last note: I called TT today and yes, they are, in fact, still experiencing the problem and trying to chase it down. I told them I can certainly understand what they are dealing with. Every time we update Windows, we end up with updates for the updates. That's what software does. It's kind of like trying to keep 20 corks underwater at the same time! That's also why this is a still Beta program.

I installed the firmware 2.041XT yesterday.

In the menus section, I see some the text appearing from the front
operational window overlapping the actual menu text.

Am I the only one?

To recall what is in memory, press the recall button located at the lower left of the screen and then make the on-screen choice that you need depending where you stored them.

Henrik,
I am running the same version and have not experienced what you
describe. I would try reloading the new version again. Probably a bit
out of place somewhere. You might even want to try downloading it again
to be sure you are installing a clean copy.

OK John,
     Thanks for letting me know you have the same problem. Wonder? Do you have on 2003 version???? That is one thing I am going to start and see if year made have anything to do with certain thing. Even though TT says they all the same. I would like to see if when posting if people would put year made in the post some where. Maybe just maybe we might stumble on something. Thanks again John.

Hi Guys,

I too have that problem. It isn't a big one, but on occasion, it is a bit annoying. I'm using my Orion II with the 2.041XT firmware. I don't get the big red area in the scope but occasionally see a signal that comes up in red. For the most part, it isn't a big problem for me....but I do miss not having the calibration above the scope. I'm undecided on the waterfall display.

5499. Orion Encoder Replacement.

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-25 19:48:58 UTC
From: adb1x1
Topic: 5499 Message: 5499

I just completed replacing all of the mechanical encoders (6) on my Orion 1 and thought I'd share soen info.

Only 1 was bad (had dead spots), but I had this bright idea that I would replace them all so I wouldn't have to to do it anytime soon.

This did complicate things a bit, but did solve the problem I knew I had with one, and made one other work much smoother.

KE5C made a series of photos detailing how to get to the encoder board and replace an encoder (http://www.w4ish.net/Manuals/pdf/Orion%20RIT%20Encoder%20Replacement.pdf). This is a very good starting point. I've listed some details I had to deal with replacing them all.

One additional thing I ran into: The VFO A and B encoder shafts pass through a bearing. The knob screws had been tightened down so tightly, that a 'nick' was left on the shafts; large enough to not allow it pass through the bearing. I had to polish this down to get these encoders out.

Here are the details:

1. The BEST thing would be to order the connector and bare board from Ten-Tec if they have these items available, and put new encodes on it.

2. Take great care in handling the board that has the gold contacts for the `chicklet' keys. I consider this a design weakness in the Orion. Not only are such keys mushy, they are easy to damage. Tactile switches with hinged buttons would have been so much better. While they work, it does complicate handling this board when servicing. I used close knit cotton gloves when handling it and made sure the room was as dust free as possible. Also made sure to wash my hands before any handling of this board, before putting the gloves on. It's very easy to cause these things to bounce or not work at all. Oil on the pads or dust on the rubber contact inside the switch will cause all kinds of problems. The smaller section of rubber `switches' will stay on the board pretty easily, but not the section around the LCD opening. This board and the chicklets were covered after the encoder board was removed.

3. Don't waste time trying to preserve an old encoder; clip the pins and if you have a Dremel or something similar, cut the mounting brackets on the encoder, then remove the pins and clips from the board. Be careful pulling the cut pins out because you can pull a pad off with the pin, especially on plated through holes; make sure the solder is well melted. The pins going through the ground plane are more apt to be a problem, the others will pretty well fall out when the pad is heated.

4. I do not have a de-soldering station due to the fact that it would be very expensive for the occasional use I would give it, so removing the old encoders was very time consuming. A bulb type de-soldering iron worked fine for the contacts that were not going through the ground plane, but didn't do much with those connections that were. Solder wick and a 100

watt gun did ok, but I finally had to use the heat and tap method (melt the solder and tap the board against something to splatter the solder out). The mounting clips required the 100 watt gun and gentle pulling on the encoder. Basically getting one side out a little and then the other until it was free. 100 watts was required, but not something you want to leave on the pad too long.

5. There is no wiggle room on this board. The tolerances for the mounting holes are very close. The holes for the clips have to be as near to solder free as possible to be able to get the new encoders on. I trimmed what I couldn't wick, suck or sling off with an Xacto knife. Even then, I had to push a small, thin flat head screwdriver into the mounting holes to make them large enough to press the encoder mounting clips into. Even after all of this, it took some very firm pressure to push them in.

6. The new encoders have an indexing tab. This needs to be cut off flush. I used a polishing wheel on a Dremel to make sure it was smooth. The metal is soft, so it's easily cut.

7. The encoder pins are very thin, and I expect, could be damage easily, so be sure to line them up well with the corresponding holes and be sure the holes are clean before pushing the encoders onto the board (when I said firm pressure before, I meant really firm at times. Might be easy to break a pin is it isn't well placed.)

8. Once I had all of the encoders pressed onto the board, before I soldered anything in place, I donned the cotton gloves and mounted the encoder board into place (with the spacers) and tightened the nylon/plastic (not sure which) `nuts' that hold this board onto the panel switch board. Once I had verified that all the encoders turned freely. I soldered one clip and a couple of pins, so the encoder would stay in place. I removed the board and soldered everything well. Again, the clips required the 100 watt gun (as well as any pins that passed through the ground plane). Exercise caution in heating the connection for too long with a 100 watt gun.

9. I clipped any excess from the leads and then used a flux removal pen to clean up the flux. This isn't absolutely necessary, but the less `sticky' stuff on the board, the better. Then wiped the board off with a clean lint-free cloth (gently).

5503. experience with #902 inrad filter for sub receiver?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-27 13:00:06 UTC
From: pa1ap
Topic: 5503 Message: 5503

Greetings,

Does anyone have experience with the #902 inrad filter which is available? Its promise of 4 Khz bandwidth instead of the stock 20Khz bandwidth could significantly improve the sub receiver performance....

Understand it would compromise the reception of wideband AM/FM but I never cared about those modes anyway....

Interested to learn experience on this.

Thanks and regards, Onno pa1ap

5504. Head-Phone volume in Orion2

I have the (perceived) problem that the volume from my head-set
headphones is much lower than the equivalent speaker volume. I'm using a
Danmike head-set (32 Ohm, 97dB @ 1mW (IEC 318))

Is there any way to adjust the relative output volume between the
speaker and head phone outputs?

Unless there is something newer than 2.041XT available that has escaped
my attention, then that is not the case - it might have been worse
before, I don't know about that, but it's definitely a problem with 2.041XT

5508. Inrad #762 600Hz replacement filter 1Khz filter

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-28 14:31:05 UTC
From: pa1ap
Topic: 5508 Message: 5508

Greetings,

I was fortunate enough to buy an inrad filter 2nd hand and used the opportunity to take some measurements while installing it. I have uploaded the pictures into the photo section.

I don't have professional equipment but you can see the difference clearly. Especially when using the pass band tuning function combined with the new 600Hz bandwidth roofing filter removes neighbor signals (at one end of course) very effective. I have not been able to capture the difference using PBT unfortunately.

I only wish the DSP switch point would be adjustable to filters installed. Right now it is "hard coded" and it would be very nice to be able to configure when a specific filter slot is used. I am not sure who uses the 20Khz slot but it would be nice to be able to insert different filters depending on the mode one prefers to operate. It would be cool to be able to change the 6Khz slot wth a 2.8Khz filter and the 20Khz slot with the 6Khz filter. Adjust the DSP BW selector to the new filter slots and one could have a perfect selectivity... Its a dream and most likely it will stay like that :-(

Best regards,
Onno, pa1ap

Excellent question Onno! I too would be interested in any feedback as well.

Some feedback on swapping out the 450 kHz filter would also be of interest. It is a EuroQuartz LTW33-450D with a +/-10kHz bandwidth. There is a narrow version of this filter (+/-7.5 kHz) available. Even narrower versions with slightly higher insertion loss (as narrow as +/- 2 kHz).

I know Barry, N1EU, was looking at the 455 filter as well.

I was a bit hasty in tagging onto Peter's Original mail

My problem is with my O1 running v1.372. While I have (just) sufficient audio to drive the headphones/headset (I have 8 pairs of headsets/phones and all are the same), if I unplug the headphones the external (and internal) speaker volume is enough to shatter the windows.

However, 600 Ohm headphones are much better (but I am guessing the audio output was designed for low impedance output).

Peter,

I have the same problem. I have read the comments from others that say
they have plenty
of headphone volume but I have always had this problem with my Orion II.

The way I solved it was to get a headphone amplifier from Ramsey
Electronics.
The model number is SHA1C. US dollar cost is $32.95. I have been using 2
of these
amplifiers for about 3 years and they work fine. No problem with RF and
I am
bringing ladder line right into the shack.

With the amp input coming from the Orion headphone jack I can now run the
volume control on the Orion at 50 per cent and have more then enough
headphone
volume. The Ramsey unit has a separate volume adjustment for each channel so
you can balance the level in each ear.

Hope this is of some help to you.

Greetings,

I am running Ubuntu linux and the application is called baudline. I am connecting orion line out to a soundcard and the application creates various FFT displays etc.

Unfortunately I don't have a traffic generator with sweep capabilities, that would be great to test the AGC system as well. When the opportunity arises I will buy one.

Hope this helps, best regards, Onno pa1ap

Subject: [orion565] Re: Inrad #762 600Hz replacement filter 1Khz filter

Greetings,

I am running Ubuntu linux and the application is called baudline. I am connecting orion line out to a soundcard and the application creates various FFT displays etc.

Unfortunately I don't have a traffic generator with sweep capabilities, that would be great to test the AGC system as well. When the opportunity arises I will buy one.

Hope this helps, best regards, Onno pa1ap

5516. 565 2063Xg user experience; include a small hang time

Yahoo group: orion565 (2009 — 2013)
Date: 2009-08-29 20:37:25 UTC
From: pa1ap
Topic: 5516 Message: 5516

Greetings,

While running the 565 with AF AGC I still found the audio a bit static even when there is no static in the air. Going back and forth with 2056 and 2063 confirmed time after time its the AGC causing the static sound. Also did A&B switch between orion and ts-480 and this also confirmed it (for me at least).

Unwillingly to surrender I have played with the controls and found introducing a small hang time certainly helps reducing what I perceive as static noise. I have set the hang time to 0.08 seconds and the static is much less then without the hang (bigger value is better but comes with a negative too). Seems to me the AGC attack is to aggresive and needs some peace prior kicking the signal.

Second setting the AGC slope to 2:10dB further smooths the signal, although its impact is only for the larger signals.

So it seems worth increasing the hang time as well setting the AGC slope to non flat.

I would also like to ask experience / advice of people running the max AF gain and reduced RF Gain model. In other words the model where the audio volume is controlled by RF gain and hence AGC is simply irrelevant in most cases... When I try this model I found that when there is no signal I hear normal noise, just as if the AF amplifier is noisy. Its a constant hiss through my speaker. Do other 565 users experience the same? To me it sounds logical that when you turn volume up to maximum you will hear the AF noise amplified through your speakers... but I might be wrong here.

My two cents, hope it helps. Best regards, Onno pa1ap

Greetings,

It's simple but here is what I just tried (and it works fine);

I am using a ten-tec speaker (4 Ohms impedance) and just put a resistor inline of about 22 Ohm. This made the sound "equal" to the headset volume and my windows don't blow out of the building anymore.

As a (unexpected) side effect I can now use the reversed AF/RF gain model. AF gain at maximum does not generate excessive noise anymore and I can nicely turn up/down the speaker volume using the RF gain.

My 2 cents (or perhaps even less),

best regards, Onno pa1ap

Until I learned to control the volume with the RF gain control, I was bothered by the noise from the Orion. It seems too sensitive to background noise. I actually enjoy the analog sound from my Ten Tec Century 21 that has no AF AVC circuit when the band is not crowded. I certainly will give your suggestions a try.

Topic: 5519 Message: 5519

Greetings,

Yahoo groups allows including questions and answer applications to be used by group members (look at left Groups Labs (beta) applications).

To test this I have started a test group and creates a issue reporting template which allows the group to structure issues and solicit feedback from other members. As a result we would have a structured list of issues found and when users provides feedback this gets automatically associated with the issue.

I have uploaded a photo of the template and hope other users and the group moderators recognize the advantage of such structure.

Best regards, Onno pa1ap

So allow me to sum it up:

A) Others are experiencing the same problem;
B)There's no user accessible adjustment available; and
C) It's really something that TT should fix in the FW, either "just fix it" or make it user adjustable.

Hi all.

On my ORION-II the headphone audio is just fine. It's very nicely balanced and switching between the speaker and head phones I don't need to touch the volume control at all. I am using a 25 year old pair of Canadian Tire "Pulser Dynamic Stereo Headphones" model MD-802B, 8 Ohm impedance with small speakers inside. I am using F.W. Vers. 2.041XT.

I wonder what others think of the Noise Reduction feature of the O-II. Lots of times I find it to be chopping and distorting the audio no matter at what setting I use. It seems to be somewhat better at wider audio bandwidth settings but I have certainly heard better ones from other non T.T. radios.

5523. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-01 06:27:03 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 5523

Enter your vote today! A new poll has been created for the
orion565 group:

My speaker connected to orion has the following impedance (select one):

There is discussion going on with regards to the Orion audio
output and it might be related to speaker impedance.

If we get sufficient response, the second poll will be about issues found
when using certain speaker impedance.

o 2 Ohm
o 4 Ohm
o 8 Ohm
o 10-20 Ohm
o >20 Ohm

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=12939520

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Onno, goede morgen!

I am not using an external speaker. In my case, the way the rig is situated, I don't need one. For what it's worth, the resistance of the voice coil, as measured with a DVM, on my head-phones is about 9.5 Ohm each.

Hi Guys

I have a MINT AS NEW NOT A MARK ON ANYTHING ANYWHERE JUPITER with blue screen and upgraded firmware software/hardware by TENTEC. Here is what comes with the radio.
* Jupiter Gray/Blue screen and new Firmware kit
* 307 Speaker factory GRAY
* 310 Cooling fan NEW
* 302 Encoder Factory GRAY
* 703 Mic
* PS2 Keyboard
All is in as new condition. I would like to trade for an Omni 6Plus w/matching power supply-speaker. Thanks
Ed N8LPQ

Do you remember my problems with my second hand ORION ? (flash update, audio bubbles etc ?)

In about 20 days (from Italy to USA and come back) TenTec service dep. return my radio like new (thanks you Paul C,)

- not intentional flash update depended by low voltage of logic board battery;

- audio bubbling dependend by bad capacitors of logic board (1-#23266 and 2-#23264)

Ten-Tec confirm another time excellent and fast repair service.

Best wishes.

Alex IT9YHR

I was just getting ready to update the firmware in my O2. Currently it's factory set at the first 2.x version which came with the radio. I was going to go with the latest version but now I see N4JZY wants to go back a version. So, which version is the most stable and best to use right now ?

Thanks in advance.

I'm running 2.041XT and really have had no issues except occasional red spikes on the spectrum display.....no totally red screen like some have claimed. I just hope that Ten-Tec goes back to calibrating the frequency scale above the spectrum display like they used to have. Personally, I don't like the waterfall display......unless it has a more vivid color display like when I'm using PSK31 on Digi-Pan.

I found the noisy clicks in 2.041XT and the lack of the frequency scale
on the sweep more than enough reason to go back to 2.039d. It also
seems that the sweep is less sensitive in 2.041. I generally don't
use the preamp, and signals under S5-S7 somewhere don't seem
to show up either on the spectrum or waterfall displays under 2.041.

So, for me, 2.039d was better in three areas that were important to me.

I hear ya Harry! I'm thinking of going back to 2.039d myself! I sure hope Ten-Tec can get the minor bugs out of 2.041XT and come out with a corrected version with frequency scale on the spectrum display soon.

Thanks. I was unaware of those problems, so for now I'll stay with 2.039d.
Shame, I was looking forward to some new features.

Out of curiosity, does anyone else have poor earphone volume on their O2 ? If so, does the new upgrades address this ?

I have to use almost full volume just to get a little audio. The audio coming out of the speaker is just fine.

73,
Sam

5538. Electret Microphone "plopping/clicking"

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-13 10:02:49 UTC
From: Peter Frenning [OZ1PIF]
Topic: 5538 Message: 5538

I have recently adapted various electret head sets and microphones to my
Orion 2, running 2.041XT, and have received report on a "Plopping" or
"Clicking" sound emanating when PTT is activated, it's fairly regular
making the sound 3-5 times per second. It's clearly audible on Monitor,
and also when monitoring the signal on another receiver.
I bias the electret element from the voltage present on Pin2 through a
2.2KOhm resistor, and it does the "plopping" regardless of whether I put
in a blocking capacitor or not.
It does NOT occur when using my 708 Dynamic desk microphone.

Does anyone have an idea what can be causing this (HW/SW), and of a cure?

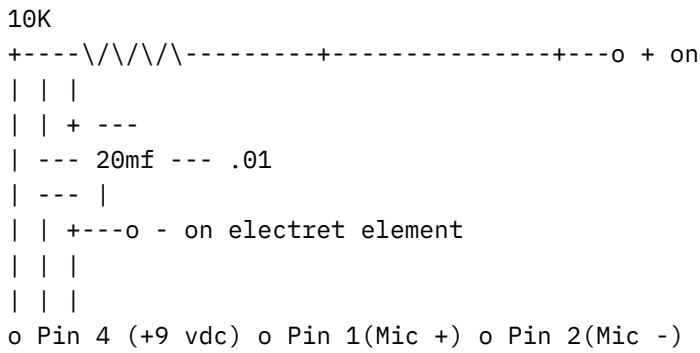
5539. Electret Microphone "plopping/clicking"

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-13 12:31:44 UTC
From: Anthony Bowyer
Topic: 5538 Message: 5539

Peter,
I use a headset with an electret element. I also use voltage present at the mic plug to power it.

Mine is like this (for the Orion 1 with a 4 pin Mic plug):



Note that PTT is Pin 3 to the shell (chassis ground). It's not clear in the 2003 manual for the Orion 1. If you are using the Mic - and the PTT that could be causing the problem.

Anthony, K4ZNO

Well,
I see Yahoo strips out the spaces I put in the schematic.

Funny though, if you click on "Reply", the quoted text is formatted correctly.

I am using Mic Gnd Anthony (pin assignment is different in the 8-Pin
socket on the O2), but I'm not using the rather large cap that you're
employing - maybe that's worth a try.

I can also add to the original qestion this: I have loaded the 2.039d FW
without it making any difference at all, so that can be ruled out.

I had the same problem with my 566 with the TenTec 708 mike. After sending the radio and mike back to TenTec, they reported that the mike amp circuit was oscillating. Apparently its a known problem. I'm not sure what they did but they did fix it..

Is it only the spectrum display area or is it the whole screen?

If you turn down the contrast, do you see upper right corner being (much) darker then the bottom left corner?

Does it happen the whole day or just once in a while?

I don't have an answer but getting some more details might trigger some thoughts... you never know :-)

Best regards, Onno pa1ap

Hi,

I wish to connect my ORION directly to soundcard of my PC using AUX I/O port with normal cable for RTTY comunication (with MIXWIN).

Any risk ?

Is better to use optoisolated connection (such as Microham USB II) ?

At moment I have tested rtty reception without any problem, but I am not sure to connect the TX directly.

Any bad experience about direct connection ?

Many thanks in advance.

Alex IT9YHR

many include 600 ohm 1:1 transformers to isolate the audio. This avoid groundloops / humming sound on the audio... I am using signalink usb and it works well for me on digital modes.

Alex, I would certainly use an isolated interface, either a
"build-it-yourself" or a SignaLink USB for example, you can read more
about both subject on my homepage (Address below).

Many thanks Peter for the very interesting link !

Thank you all for the suggestions.

Best 73'

I bought a chinese headset for $2 and want to try it with my Orion I because the initial tests with sound card on Skype were very good. This headset has an electret mic and a conventional 3.5 mm jack for the sound card input. I am not a keen phone op but I became curious how will it work. Anybody tried such cheap headset to hook up to Orion (4 pin mic conn.)? How to wire it?

Hi Martin,
Computer head-sets/microphones are normally wired such:

Sound Blaster Microphone Input
or such:
**

```
/ \
| | Audio signal
\ /
+===+
| | Bias voltage for microphone (+5V through 2.2 kohm resistor)
|===|
| |
| | Ground
| |
+=======+

| |
```

**

and yes, I've hooked up a very cheap Labtec 203 head-set to my Orion 2,
with excellent result (apart from the "plopping" and low audio volume,
that is)

BTW: Thanks for CQRlog!!!! use it every day almost (for those not in the
know: CQRlog is an excellent general purpose log program for Linux,
written and maintained by OK1CQR and OK1RR)

5555. PC headset (was Electret Microphone "plopping/clicking")

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-15 14:34:25 UTC
From: Anthony Bowyer
Topic: 5555 Message: 5555

Martin,
The ASCII schematic I posted is how the mic adapter is wired for a Plantronics gaming headset (for a PC). This one has sealed ear cups so is better suited for me, but this adapter should work for about any PC headset. All the parts fit into a 3.5 mm stereo in line socket (with a little trimming).

The 20mf capacitor is a surface mount part, which was a bit challenging to get in place, but wasn't too bad.

I found that the 10k resistor works better than lower values. It supposedly sets the basic impedance of the electret element, but I found lower values tend to cause the mic to be more susceptible to RF.

For the headphones, I just made an adapter with a 1/4" plug on one end and a 3.5 mm in line socket at the other. The length was chosen so the mic adapter and headphone adapter sockets met evenly at the end. These cables are about 6 inches long (approx 15 cm).

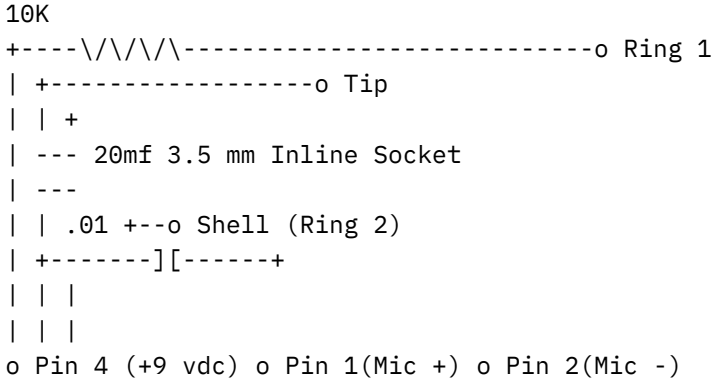
These two cables (actually 3, I also added a 3.5 mm socket for PTT), are covered with copper braid from a piece of rg-8x to within about 5 cm of the in line sockets. This braid is grounded to the frame via the shell of the mic plug. This entire cable bundle also has heat shrink tubing to protect the shield and hold everything in place, as well as a small wire tie at the transceiver end.

I hope this is helpful!

I just realized there is an error in what I previously posted. The .01 mf capacitor is across the mic audio, not the power.

Also it's a little different for the PC headset mic since there is a separate power connection.

I know the spaces will get removed again, but if you do reply, it show correctly



Orion End

From: kzerofl
Topic: 5556 Message: 5556

Just wondering what ALC settings you guys are using. I have a hang of .55s on the slow, a .40s on the med, .12 on fast, and 2.3 on prog.

Is there a easy explanation on just what the decay and threshold are and what settings might I try?

Thanks in advance

Tim KØFL

From what I have been able to gather the threshold determines the point where AGC will actually activate. Decay is how fast it will react on signals above threshold and hangtime is how long gain will freeze when signal goes down again. With different firmwares the AGC works a little different and this is undocumented so far. Even with latest firmware there is no clear explanation of what exactly AF/RF Gain does in relation with 1:10 / 2:10 ratio...

It seems some orion users decided to perform their own AGC function by whats refered to as the reversed AF/RF control. RF Gain turned down and AF control turned up to max. Signals are processed through turning RF gain slowly until enough sounds comes out of speaker. No need for any AGC settings when using this model. With orion 565 this model works too however there is excesive noise coming out of the speaker, even without any signal... This might be related to speaker impedance (in my case) but this is different topic.

Common practise is to go to empty part of the band of interest, look at the s-meter and turn up threshold until the s-meter moves just a little above the band noise. This way AGC is not activated on the bandnoise. Some versions don't update the s-meter (orion 565 release 1) and one has to listnen to the band noise to determine the best point.

The hang time is nice for rag chewing. It makes the sound more smooth by taking out the dynamics between words. Decay at 10dB/s and threshold at little higher then band noise works well.

Small signal detection might be impacted by AGC actions. Threshold will help ensuring the AGC not to kick in (good) on those tiny signals. However threshold, hang time and decay wont do miracles lifting signals out of the noise...Its more the opposite actually...I have not found any evidence of that miracle yet. hope somebody can demonstrate that.

Check the files / photo section of the forum. You might be able to find some other documents or hints.

Best regards, Onno pa1ap

5558. 2.041XL beta firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-18 13:29:33 UTC
From: ne7x
Topic: 5558 Message: 5558

I installed 2.041XL beta and found the display looked unsatisfactory. It smashed all the passband tuning icons into the bottom of the passband numbers, it did not have any sweep width adjustment and all the freq markers were gone. So I went back to ver 2.039d

I am assuming since this is "beta" software, these issues will be addressed in the released version.

I think hang time is how long the agc stays at the maximum level once activated and, once that hang time has expired, decay is the rate at which the agc level returns to zero.

Would a person want a slow decay in a round table? I'm starting to think
this could be something very useful to use.

From: pa1ap
Topic: 5556 Message: 5562

You can easily hear the difference using small or large decay. Just try it :-)... Large decay the noise jumps up between words and this can be very exhausting to listen to. I am using decay of 11 with a hang time of 0.08 and this works fine for me.

A large decay is aggresive on recovering the max gain. Large signal will trigger AGC to reduce gain and when large signal is silent the AGC will "recover" the gain again. The question is how fast this gain will be recovered (decay value). I guess when you are running a cw contest with very large signals combined with very weak signals you want the gain to be quick to avoid loosing the weak signals due to desensing of the receiver. a large signal burst would decrease gain but when silent again, gain would recover quickly allowing the weak signal to be heard at similar audio output.

Yes Bob is right on the hang time I believe, my wrong. Thanks Bob for your advice!

What i have not been able to isolate yet is what exactly "peak gain" would rever to when using hang time. Is it a timeslot derived average of the signal(s) present or is AGC gain frozen for that period, followed by some other period of gain... what would be that next period of gain? Hang time is connected to a reference but its unclear to me how this reference is determined in such a dynamic environment as signal processing...

Sorry for the confusion on hang-time.

Best regards, Onno pa1ap

5563. SEPARATE OUTPUTS FOR MAIN AND SUB RECEIVER AUDIO ?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-22 21:28:06 UTC
From: i2dmi
Topic: 5563 Message: 5563

Sorry for this post; maybe it is a COLOMBO's egg.

In my 566, I am not able to get two outputs for separate main receiver's and sub receiver's audio to be connected as left/right channels in my stereo computer's sound card.
I know there are several options in the audio menu and in the Other menu.
I am able to get Main, Sub or Both at the same pins (AUX # 4) and "LINE OUT", but no way to get TWO different outputs (except on headphone jack).

The 565 uses pin #4 and pin #6 for separate Main and Sub receivers
The 566 uses only pin #4 for audio output. No connection on pin # 6. (Am I wrong?)

In the internal AUX card there is a empty "J39" socket. Maybe is missing here a connection cable for sub-receiver's audio?

Any help on this problem please?
73 Frank I2DMI

5565. RE: [orion565] ALC settings

Yahoo group: orion565 (2009 — 2013)
Date: 2009-09-23 19:26:17 UTC
From: Larry Menzel
Topic: 5556 Message: 5565

Sorry I□m so slow to respond to this thread, but I just got around to checking my TT mail.

OK, several years ago, when I got my first Orion, I got this very helpful email from WA3FLY regarding the AGC adjustments for the Orion.

I have used these as the starting point for my personal tweaking. I think you might find it useful, as well.

My hearing isn□t what it used to be, so I like a very good signal to noise ratio when I□m listening. I operate mostly CW, by the way, so this may be modified for a SSB profile as well. I like to have the receiver quiet between elements when operating QSK, as well as when listening around. So here□s how I set up my ALC.

First, be sure to turn the RF Gain to 100, as you□ll be watching the S meter when making these adjustments. Reduce it again when the settings are done. Keep in mind that you□ll not hear the greatest differences when the RF Gain is reduced, but the AGC circuit will still be working.

SLOW

Hang 1 second

Decay 10dB/s

Threshold 11uV or about S6-7 on the S meter

MEDIUM

Hang .5 seconds

Decay 20dB/s

Threshold 5uV or about S5 on the S meter

FAST

Hang .2 seconds

Decay 80dB/s

Threshold 1.4uV or about S2.5-3 on the S meter

PROG

Hang .1 Seconds

Decay 200-1000 dB/s (you set it the way you like it)

Threshold 1.0uV or about S2 on the S meter

I set my AGC Slope to 2:10 dB

I use SLOW AGC when conditions are pretty good and work down (Med, Fast, Prog) as conditions deteriorate or I want a bigger signal. Having Threshold available in the AGC settings makes it very convenient for me to quickly set the best performance for any conditions. I can still use the RF Gain to reduce RX gain further if desired. As there are a veritable panoply of AGC settings available, YMMV, of course. But this is a good starting point.

-I just put in 2041 last night... While I miss the frequency markers a little - which I assume will come in due time - I definitely like the more detailed sweep...
And the sweep freezing while tuning with the little blue bar indicating where you are tuned relative to the sweep is an interesting gimmick... It isn't the best thing I have seen since sliced bread but it is workable at least...
I think someone was unhappy about red marks in the scan... From what I see on my radio, it appears that the white peaks go red when the signal strength is decaying or the signal has suddenly disappeared... There is a decay time or delay in repainting the entire sweep and making the peaks turn red to indicate loss of signal strength likely uses less CPU time until the Dragon can crunch the numbers for a complete repaint...

I urge TT to put some effort into sucking out IF to an accessory display with point and tune, etc., like the K3 does with LPPAN...

Greetings,

Finally got the time and found a place to order those theatre gels as suggested by James K4QO. Its a great adjustment for little investment (about $8) and you can select from a wide variety of colour.

I have used "Lee 021, gold amber" which seems a little to dark to my taste but it really looks nice compared to the blueish / black screen.

Just cut out the right size of gel and carefully place it against the lcd window. It will stick automatically and you can easily remove it to.

I have uploaded some photo's to illustrate the difference. On the color, I am now ordering Lee 134 which is a little lighter orange.

All credits to James, K4QO for sharing this great harmless modification.

Best regards,
Onno pa1ap

James, K4CQ invented the idea and shared it with the group earlier. He might have better information available. Below my limited experience on the topic, hope it helps;

Below the link to one of the companies producing those theatre gels.

I bought the gel in a local music shop where they sell any type of music instrument but also DJ equipment (like theatre lights).. Another source where you could check is a good photocamera shop since those filters are also used to create the right colour setting when making picture.

http://www.leefilters.com/lighting/

I would personally recommend a little lighter version then "Lee 021 gold amber", perhaps "Lee 134 golden amber" works a little better since its a bit lighter.

Some experience on using the gels;

1) Gels are made of clear polyester foil. After that they essentialy paint it (both sides) with a colour. There is a great video on the website which talsk about this process.

2) The paint will desolve when you use alcohol. I learned this through trail and error :-)

3) When you only apply the gel to the LCD screen, the color might be different then the s-meter. If you like to make them equal, just cut out a piece of gel for the s-meter as well

4) the gels should be cut a little bigger then the visual part of the lcd / s-meter. At my 565 there is some room behind the front panel and hence its nice to have the gel cover this area too. Its a precise job which requires patience...

5) the gels do add a mirror effect to the lcd screen. As long as you make sure the gel is smooth and properly attached its fine and not disturbing to much. I have looked around for gels which dont have this mirror effect but not found it yet.

6) the paint should not be underestimated. When i played with the alcohol (trying to remove my vinger prints) I actually painted my fingers. They are still orange after two days :-).....

7) When you cut and mount the gels, please wear cotton cloves or something like that to avoid the vinger prints.

Hope this helps,

Best regards,
Onno pa1ap

Onno,

Glad you tried that gel idea - it was easy to "apply" and easy to reverse. Not sure what the alcohol was for, but it's good to know that about the gels.

I found that to my eye, the gel that made the main screen match the stock gold color of the meter was actually redder than you'd think. But it seems that to offset the blue color of the screen to make it gold like the meter, that's what it took. The "color number" of the piece I have is "7450", and I don't know what gel company that came from. Like Onno, I found the gels at a theatrical supply company.

I bought other colors to try like blue or green but went back to the "gold" color after a while. The nice thing is there is no impact to the display or case and it can be changed in few minutes.

Thanks for trying the gels! I'm off to look at your pictures!

73,
Randy

Hello Randy,

My appologies for refering to you as James. I have been lazy and just did a lookup on qrz.com. Hope it did not upset you.

Yes its a great adjustment and its really nice to look at the lcd screen now. It also hides the contrast change overtime when the rig heats up.

I actually got used to the new golden orange colour and have it set to black / orange now. Its like looking at a new rig :-)

It doesnt change performance of the rig, i will not hear any station i did not hear before, output power does not change... but it makes it so much nicer to look at the rig.

It would be great if we could find a way to highlight the front panel to be able to work without much light around the rig. On my ts-480 the buttons contain small lights which is great for working under limited light conditions. I am looking around for a small led lightbar I could mount above the orion to provide sufficient light to operate the rig at evenings. The theatre gel could provide the right ambience :-)

Randy, curuous how you arrived at the idea?

Thanks and best regards,
Onno, pa1ap

I did a search on the gels to learn manufactors and such like;

Randy has used 7450 which is manufactored by Apollo Design technology

http://apollodesign.net/

7450: Good fire light color. A Serengeti sun color. A deep rich color. (info apollo)

On this website they also include a "translator" which allows you to take another vendor color code (Lee / Rosco / GAM) and translate this into Apollo code. And if you go to those other manufactors they provide the same :-)

http://www.leefiltersusa.com
http://www.rosco.com/
http://www.gamonline.com/catalog/gelfile/

This allows you to take pretty much any brand while arriving at the same (or close) result. I personally find the Lee 021 a bit to dark and i am ordering Lee 134 which is a bit lighter orange. Have a look at the website and the colours.

Best regards,
Onno pa1ap

I have now been able to compare Lee 021 and Lee 134. lee 021 is my preference since it really gives a fancy color to the orion. Lee 134 is a bit "cold" and not as warm/comfy as the 021. In case you consider the gels from Lee I would suggest 021.

Enjoy and best regards,
Onno

I must admit that is a new one one me. I have 4 Orion 565's that I have updated the firmware and never had that problem. I recently installed the beta version and I love it. Look over all you setting and do a master reset. If that does not work reinstall it again, Or install the beta version. Down load the history on the versions and you can see what they have changed or mostly added. I do not believe it is the fault of the firmware

Greetings,

It feels i can almost write a thesis on this topic by now... Yes I have detected the distortion as well. Depending on the version of firmware its more present then others.

Below my observations:

Within release 2;
The only firmware being clean is 2056.
All version prior to 2056 simply dont work well.
All versions after that contain significant dsp artifacts.

Right now I am running the latest beta version (2063xG?) and RF AGC is plain horrible. AF AGC is better but has a very irritating "plopping" when there are strong signals present with fast rise time. It sounds like a poor vox on the transmitter side of the station I am copying (you hear a click when they start talking). When I do A/B test with kenwood 480 the "plopping" is not present while listning to the same qso.

Firmware 1372 has digital artifacts too, present in the out of band spectrum. The later 1.x versions have similar issues, perhaps little better but they are unstable for control.

I have done memory reset, system reset, step by step upgrade, nothing changes those issues. It seems to make a difference though when moving from release 1 to release 2 when you first upgrade to for example 2.x, reset the stuff, followed by upgrade to release 2.y.

When I want best audio I am loading 2056. Beautiful audio and absolute distortion free. No other rel 1 & 2 firmware beats it (unfortunately).

Check the files section, I have uploaded some information about the tests I performed which in my opinion clearly show the distortions. They are also present in the out of band spectrum and although they are about 20dB lower in volume, the human ear will certainly hear those signals.

I can not explain why some people find absolutely no problem and why I am one of the few reporting issues. Perhaps the ones not having problems have outside factors reducing the distortion such as headphone instead of speaker, active / passive filters between speaker and orion, low versus high impedance, I don't know. What I do know is that the measurements confirm the distortion.

Its a great rig with huge potential. I am looking forward to a stable firmware to secure that.

Best regards, Onno pa1ap

5588. Advice on how to test AGC function?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-04 10:06:38 UTC
From: pa1ap
Topic: 5588 Message: 5588

Greetings,

I am creating a testbed for testing receiver AGC functions and hope there is existing experience in such environment? I notice when going through the arrl tests there is a mention of AGC but coverage seems limited. I learned AGC can really impact receiver performance and hence its a bit suprising this area is not really tested yet.

Below my thoughts on testing AGC;
AGC seems all about reaction on signal variation. Take a stable RF generator which can change very fast signal levels and each time a signal changes a trigger pulse is send to some external device. This external device combined the audio output with the trigger pulse to see the reaction on the change. This way input and output difference can be captured and analyzed.

Second test area would be around full spectrum AGC testing and how this would be different from single signal AGC testing. My guess is that this will provide different outcome.

I did some initial tests and results are promising. I have seen the effect of threshold already. Decay and hang-time has been harder to test so far.

Looking forward to suggestions!

best regards, onno pa1ap

Onno,

Can you explain the chart.

Henry.

Hello Henry,

The chart provides so called presence probability. Vertical axe provides probability (0-100%) and horizontal axes provides amplitude. Amplitude is both positive and negative, just like one would see when looking at an oscilloscope monitoring audio. One can split the picture in 2 and ignore one side.

I have created the view using band noise only. Just as a reference to see if there is a difference when using various AGC functions.

The red graph is with AGC off. Here one can see much more presence on high amplitudes. This translates to higher audio presence, which one can also clearly hear when disabling AGC. All signals will be amplified...

The green graph is with AGC prog and threshold below band noise. Here one can see (already) that there is less presence on high amplitudes.

The purple graph is with AGC prog and threshold just above band noise. Here one will notice a significant improvement with regards to audio presence. band noise is not leveled any more by AGC and hence less audio comes out of the speaker.

I prefer using AGC prog and adjust the threshold to a value just above the noise or signals I don't care about. Makes listening a lot nicer but I could not figure out any factual data such as x dB improvement. With this test I hope I can actually connect an improvement value to correct threshold setting.

It seems we all pursue a setting where undesired signals have NO presence and desired signals are very present while listening.

I have used firmware 2056 since its the only firmware with clean audio. This to keep the results as predictable as possible. Audio presence on other firmware is a higher due to unexplained distortions.

I am working on repeating the tests using weak and stronger signals (generator) to see how the audio presence is processed by the AGC function.

Hope this helps?

Best regards, onno pa1ap

To provides some examples;

70dB amplitude presence:
Red: 68%
Green: 62%
Purple: 32%

75dB amplitude presence:
Red: 48%
Green: 40%
Purple: 4%

I have a document which describes the human ear perception of audio presence. 3dB is not perceived by the ear / brain as a factor 2... its a lot less then that. When mapping the perceived audio presence to the presence probability results one can better understand perceived improvement.

Hope this makes sense,

Best regards, Onno pa1ap

5593. Fried PA FET

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-05 00:35:03 UTC
From: Stan
Topic: 5593 Message: 5593

I heard a loud click this afternoon while loading up the amp with the Orion, and now the Orion (565) has only about 5W output. I assume that the PA FET got fried and that what I am getting is from the exciter stage. I unhooked it from the amp and fed it straight into the antenna, and I still get only about 5W out. I have replaced FETs in other rigs with no problem. Has anyone done it with an Orion, and is it fairly straightforward, or is this one of those unfortunate deals where you have to send it to Sevierville? I will call them in the morning to see what they say, but just wondered if anyone here has experience replacing the finals.

Thanks,
Stan, W4AG

I have uploaded a couple of pictures to the directory below, connected to the topic of "sound presence".

A quick summary of it;
1) Ignoring the threshold value means you hear the band noise at a level of two people having a converstation in the same room.

2) Adjusting threshold just above bandnoise means you hear soft whispers / rustling leaves....

http://groups.yahoo.com/group/orion565/files/pa1ap%20agc%20stuff/

The DPF histogram allows presence to be visualized and hence the AGC function can be demonstrated.

Best regards,
Onno pa1ap

Greetings,

What you can deduct from the threshold curve is that signals below threshold will not be leveled to constant audio presence. As a result those signals will not sound that loud as signals above threshold. Above threshold all signals are leveled to a constant audio presence.

I guess if you are lucky enough tweaking the threshold in such way that it is above undesired signal and below desired signal you might hear the desired signal pop out of the "noise"... This will only work when band noise or undesired signals are low (like s1-s3) since the threshold resolution decreases quickly above about s3.

Supose band noise is at -100dB (about s2). You move the threshold to -90dB (about s4). You know right now that any signal above s4 will sound 10dB louder then the band noise. Moving threshold closer to band noise, to for example s3 results in a smaller difference, somewhere in the area of -96dB the desired signal above threshold will sound about 4 dB louder... Its questionable this generates enough audio presence to be noticed....

Hope this helps and is useful.

Best regards,
Onno

5598. AGC functions explained

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-09 07:29:31 UTC
From: pa1ap
Topic: 5598 Message: 5598

Greetings,

I am perhaps one of the slowest students ever and thank you all for your patience. I have summarized what I understand so far from the AGC function with orion. Please provide suggestions or comments where needed.

Our starting point;

We have an IF amplifier with constant gain (adding 10dB RF signal results in 10dB louder audio presence).

With no AGC function any RF signal level will be translated in a certain audio presence following a linear gain model.

When RF signal combined with the constant IF Gain results in a very loud audio presence we need a mechanism to adapt the IF gain. This to protect our ears but also to avoid the audio chain to start clipping on to much audio.

By default the AGC on orion 565 starts at 1uV*. Any RF signal level below this will be treated with constant IF gain. Any RF signal level above this 1uV* will receive a variable IF gain. IF gain could be increased or reduced in order to meet a constant "reference audio presence"

And here starts the trick with threshold. Adjusting the threshold allows you to change when AGC will activate. In case band noise is at a S-4 signal level you can move the threshold just above the band noise. As a result th band noise will not be processed by AGC and hence band noise audio presence will decline.

Opposite applies to RF signals exceeding the threshold value. Those signals will be processed by the AGC function to meet a constant "reference audio presence". Interesting to realize is that this applies to all RF signals above threshold. In other words a RF signal level just above threshold will sound a loud as a RF signal level at s9+60dB. You will not hear any difference in audio presence.

Decay fits very well into this as well. Rf Signal levels above threshold will receive a variable IF gain factor depending on their strength compared to expected constant "reference audio presence". The speed to adjust this variable IF gain is determined by the Decay value.

Hang time is all about avoiding a RF spike triggering the AGC Decay value. Since its all about probability I am not sure what the best value could be. Feeling wise I would set it to a very small value (0.08S or something like that) since it would not harm any reception and might avoid false triggering of decay.

Last but not least we have new options within the AGC algorithm such as 1:10dB and 1:20dB... This is an attempt to provide a differentiated constant "reference audio presence" where just above threshold RF levels will sound a little weaker then the way above threshold RF levels. I will see how I can test this and will share the results if

thats of interest for someone.

Ok, hope this helps and I hope my observations are correct.

Best regards,
Onno, pa1ap

*1uV = although the threshold is providing uV reference point there is no relation at all with any real RF signal level. Best is to use a cheat sheet which provides threshold value to s-meter value.

*reference audio presence = the audio which comes out of your speaker based on the AF gain dial.

5599. Automatic threshold setting program

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-11 06:02:31 UTC
From: pa1ap
Topic: 5599 Message: 5599

Greetings,

I am considering writing a small program to adjust threshold value automatically. The program would use the s-meter reading, take the minimum values over a certain time interval and adjust the threshold value to the measurement found. There are other ways to do this (like using sound card) but this would be a bit more complex to do.

I dont want to re-invent the wheel here, anyone wrote this type of application already? Any suggestions or advice on things to take into account?

Thanks and best regards,
Onno
p.s. yes I agree that ten-tec could have made such auto-threshold button in one the menu's....

I can only guess you want to write a PC program to do this. I am wondering about this because I have noticed that the software I use (hamradiodeluxe) reports different values for S-meter readings than the ones diplayed on the radio.

maybe I am wrong... anyone else?

Greetings,

First scripts are ready and working. Had some challenge developing serial communication script... has been a long time agoo :-)

Anyway, I first developed a script which increased threshold step by step and each step I took the associated S-meter value (main receiver). This way I have created a correlation between s-meter value and threshold value.

Second I quickly wrote a script which disabled the AGC, takes 10 s-meter samples, selects the smallest value out of that range, returns to AGc prog and then sets the threshold value based on smallest s-meter value... Just like one would do manually...

Its fun to use and it works well so far. It might be nice to use the sub receiver for the determination of threshold value and leave the main receiver alone during this process. Then the effect might be better noticable... I will work on this.

During the first script routine I noticed the orion s-meter values are not linear but we knew this before. Second it is possible to set threshold in 0.01uV steps and it will accept this. I am not sure if it actually gets applied though...

Anyway, I have tested the threshold script on empty frequency and the threshold value was right on. Then I changed to cw part of the band and tested it on very strong signal. The script picked up very nicely the lowest s-meter value and adjusted threshold to it. With weak cw signal it worked well too...

It takes out all the manual tweaking in a matter of seconds...

More news to following when I have time to refine the routines.
Best regards,
Onno

Onno -

What correlation do you use between the S-meter value and the threshold value? Do you increase the threshold enough to just increase the minimum S-meter reading?

5603. Re: Automatic threshold setting program

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-12 10:45:06 UTC
From: pa1ap
Topic: 5599 Message: 5603

Process to establish the correlation:
I created an array containing threshold value (uV) and corresponding s-meter value. When you turn up the threshold, the s-meter follows with it.
To create this reference array I performed the following:
1) orion RX not antenna
2) set threshold to value X and read s-meter value y
3) store X and Y into the array

Real signal threshold setting process:
1) switch off AGC
2) read s-meter value y
3) do a lookup within the reference array for closest match on value Y and retrieve value X (threshold)
4) switch on AGC
5) set threshold to value X

When using firmware release 2.x this pretty much reflects the manual operations one would do. Perhaps not the AGC off step but certainly a visual lookup on signal level and threshold effecting the s-meter reading.

With release 1.x one will have to hear the sound go a little weaker to determine the optimum threshold value...

This is a first routine which I am playing with. I might add variables such as up or down a step / percentage... It all depends on the effective usage of automated threshold. I will need to learn and experiment with it...

So far, after one night of coding, I found the routine to be pretty accurate. I felt tweaking the threshold to make little or no difference to the audio after the routine did its job. In other words, so far I am happy about the results.

Hope this helps,
Best regards,
Onno

5604. Settings for 715 and 565 with 709?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-12 11:14:38 UTC
From: Edward A. Feustel
Topic: 5604 Message: 5604

I am trying to find settings for the 715 when used with the
565 and the 709. If possible, I would like to have a
single setting for operation with the compressor in or
with the compressor out.

Without the compressor, I use a speech processor setting
of 3 and a mike gain setting of 50. I understand I will have
to turn off the 565's speech processor. Normally I use PTT,
but this does not seem possible with the 715. So I will have
to turn on VOX.

How have others configured their 709/715/565 for operation?
Have you been able to achieve a configuration that serves
with and without the use of the 715. Do you use the 565 User Settings
Memory to switch from Compressor On to Off?

Thanks and 73,
Ed, N5EI

Greetings,

I just played a little with the auto threshold script on weak signal.

http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/

empty part of the band, antenna connected:
red: threshold @0.37uV
green: auto threshold
weak signal on the band, antenna connected:
orange: threshold @0.37uv with weak signal
yellow: auto threshold with same weak signal, a few Hz up

Audio presence (histogram) certainly changes when threshold is adjusted. No conclusion yet... Never the less its fun to play with the orion and explore the possibilities. More to follow...

Best regards,
Onno

5606. AGC Settings

What are some good starting points for the program AGC for CW and SSB.

5607. Re: AGC Settings

Yahoo group: orion565 (2009 — 2013)

Topic: 4197 Message: 5607

Greetings,

My personal view (limited by perception):
Threshold a little above (band) noise / undesired signal*. Decay 5-10dB for casual ssb communication. Decay 10-20dB for ssb contesting. For CW contesting Decay could be a little higher if you can bare the additional signal / no signal noise.

Use no AGC function is another way of operation. Turn down RF Gain and turn up AF gain to max. Then control audio presence by turning up the RF Gain until you hear what you want to hear... This way your fingers are the AGC function. Seems to be a popular mode by many users.

There is really no difference between AGC slow / medium / fast / prog except the default settings they contain. You can tweak all of them to whatever you desire.... I have changed the Threshold on all of them to a little higher value to adjust to the band noise I have overhere. Then I can cycle through the AGC modes which contain different Decay values and I can use what I prefer at that moment in time.

Hope this helps,
Regards, ono pa1ap

*Firmware 1: turn up threshold until the audio presence drops down. Threshold does not influence the s-meter reading (no visual feedback about threshold value)
*Firmware 2: turn up threshold and watch the s-meter increase value. Stop when the s-meter pops over the s-meter band noise indication. That should get you in the approximate area of correct threshold value.

From: Sam
Topic: 5608 Message: 5608

Since purchasing my ORION II several months ago my radio has been used on 75 meters almost all the time. Recently I wanted to work a station on on 20 meters and found my audio was cut to almost a 10th of what my settings were for on 75 meters. I had to crank the MIC gain from about 35 to 100% to start with.

I called T*T about this and they told me the audio settings between different bands are different, and adjustments would have to be made, however I called two friends that also have ORIONS and they told me that their transmit volume stays the same on all bands ??

Who is right ?

Thanks 'n 73,

Sam

Depending on the firmware the answer is correct.... In the latest firmware there is an option to set global or per band. Its in the menu settings.

In case the menu setting is at global another issue could be the cause of the issue you found. RF Feedback will mess up any audio setting and typically it feels like you dont have enough audio to get some TX output. ALC doesn't display the expected etc...

Hope you can find the answer to the issue.

I have not noticed any significant differencies between the bands on my
O2. Settings I use: TT-708 Desk mike (dynamic) = 75; Boom Mike
((electret) = 50; DanMike Headset (electret) = 25;

There might be a slight difference between bands but nothing like your seeing.
I never change mic gain between bands here. It must be something else causing this problem.

What version of firmware are you running?

There is an option as to using the same settings
by band, or more of a global setting for things
like power output/etc.

So, everyone is right? B-)

Check your settings there: (using the latest firmeware)

Go into ...
MENUS
Other
Mic/Pwr Setting
Then choose "Per Band" or "Global"

That help?

I have been lucky I guess combining the right conditions with finishing the threshold routine using the sub receiver for measurement and taking the result to the main receiver threshold setting.

I have captured a qso on 80, where the ssb signal was about S4 to S5 and band noise around S3. The recording starts with default threshold setting and after about 5 seconds I started the auto threshold script... The results are really promising... There is a mp3 recording as well the matching audio picture which confirms the audio strength does not suffer from the auto threshold script...

http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/

Have a look and let me know what you think.

My Orion II is using the 2.039 ver, and my audio is the same on each band.
I'm using a Heil HM 10 with the HC5 element and always get good audio
reports.

Per-Band vs Global choice introduced with 2.041XL:

Version 2.041XL – Beta Firmware
Enhanced SWEEP function with enlarged display and tuning cursor
User selectable RF or AF derived AGC
Optional Per-Band or Global MIC/PWR settings
Enhanced A>B VFO Copy function
Increased headphone audio level

I have to turn the mic gain up from 40 to 50-60 and the SP from 4 to 5 to get the same audio out when I go from 75M to 20M, so, yes, this problem does exist. I am using the latest firmware version. Will have to look for the global setting others have referred to, which will maybe fix it.

Maybe not. He may have acquired the unit with 2.063Xg installed. That's a problem -- if Orion manual is not updated with the latest firmware features, how is a buyer to know how to use them? (The 565 manual is dated Sept, 2003!) Maybe they enclose a surprisingly helpful update sheet with a new O II? I don't know, having bought my 565 many years ago now.

In fact the published Firmware History notes are pretty minimal. They don't really explain the new features or help users know how to use them.

I purchased a new Orion ii from Ten Tec this year. The operator's manual is dated as Version 4 - October 2006. What is included in the manual is generally fine but I miss having actual schematic diagrams of the various circuits with voltages, resistance, photographs, etc. My Ten Tec Century 21 operator's manual is superior in covering all these details.

Maybe not. He may have acquired the unit with 2.063Xg installed. That's a problem -- if Orion manual is not updated with the latest firmware features, how is a buyer to know how to use them? (The 565 manual is dated Sept, 2003!) Maybe they enclose a surprisingly helpful update sheet with a new O II? I don't know, having bought my 565 many years ago now.

In fact the published Firmware History notes are pretty minimal. They don't really explain the new features or help users know how to use them.

I believe there are some schematics on the TenTec web site. I do not know whether or not they cover the entire radio.

I purchased a new Orion ii from Ten Tec this year. The operator's manual is dated as Version 4 - October 2006. What is included in the manual is generally fine but I miss having actual schematic diagrams of the various circuits with voltages, resistance, photographs, etc. My Ten Tec Century 21 operator's manual is superior in covering all these details.

Yes, as far as I can tell, there are schematics for the whole radio. I downloaded and printed them all out, about 30-40 pages!

From: Don Kasten
Topic: 5598 Message: 5625

What I am not clear on is where (assuming a TT 565 or 566 and allowing for different firmware versions) in the AGC loop the S-Meter picks off it's signal level. Is it prior to AGC action, giving an accurate indication of relative RF signal strengths or is it post-AGC, possibly presenting a deceptive comparison of two, hypothetically widely varying input signal levels?

73,
Don

From: pa1ap
Topic: 5598 Message: 5626

Hello Don,

You raise a very good question. I wish I could confirm from a design point of view....

If we look at the behavior we find Decay and Hang-time to influence the s-meter reading. Also running the latest 2063xG firmware (565) there is a significant difference between RF and AF AGC s-meter reading....

Since all seems processed within the dsp the s-meter routine could actually be very intelligent, picking up various variables pre- and post- agc. This way a combination can be made to arrive at most flexible and accurate readings...

What I did notice is that there is a significant difference between threshold value and associated s-meter value when comparing main or sub receiver.... They are not the same and this means setting threshold on main does not mean duplicating its value to the sub provides the same result... Just something to be aware off...

Something else I realized is that with strong band noise it helps to include additional attenuation prior to setting threshold. It seems the dsp has more dynamic range and threshold adjustment really articulates at that moment. I have uploaded two mp3 files which demonstrates the effect...

best regards, onno pa1ap

I find that unusual! I'm running firmware version 2.039d and my settings remain constant on each band. I did update to 2.041XT, but didn't like not having any frequency calibration for the sweep. The waterfall was not very impressive either. Guess I'm too used to the waterfall on MixW 2.19!

Thanks to everyone who commented on the Transmit Audio topic. I recently purchased a like new 565AT and I was starting to regret my purchase because I was having the same wide swings in audio settings from band to band. My menu was set to "global". Moving it to "per band" fixed my problem. I now have the same audio settings from 80 meters to 10 meters.
Thanks very much and 73,
Mike, WC0L

Odd. That's the reverse of what I'd expect. "Global" should apply the same setting to all bands. Maybe a Master Reset (or Battery Reset) is called for.

5630. Unknown character in display

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-16 16:15:16 UTC
From: N2FQ
Topic: 5630 Message: 5630

Hello.

I'm a new owner (few months) of a very fine 565 which

now has Version 2.063Xg.

I get a character (currently the letter 'A') to the left of 'TR'

on the screen. More precisely, it is over the hundredth digit on the VFO A

frequency display. Previously it was the letter 'C' so I decided to do

a Master Reset which made it a 'A'.

Can't figure out what I did nor what it means.

The firmware upgrade on TTWiKi didn't say anything about it.

Can anyone enlighten me?

tnx.

Fernando N2FQ/6

This indicates which band stacking register you are on. Say, for example, you are on 20M. Push the 20M button. You will see the letters scroll to B, then C, then D, then back to A each time you push the button. In each of these registers you can set the frequency, mode, etc., and can return quickly to that particular band and mode. Say, for example, you set up your radio on 14.250, USB, with 2800 Hz bandwidth. You can push the 20M button, see a B on the screen, and set that up for 14.025 CW with 500 Hz bandwidth. To return quickly to SSB at 14.250, you push the 20M button three times, scroll though the C, D, and then back to A, which was previously set for 14.250 SSB at 2800 Hz. That way you can scroll quickly to up to four different band settings and modes by only pushing the 20M button instead of having to reset all of your band/mode settings. Have fun....Bernie K1SA

You have 4 bandstacking registers labeled A,B,C & D. Keep punching the band button and the letters will change.

Hi Fernando, Try this ...

Look at your display screen and note
the "A" ...

Push one of the BAND BUTTONS one time
and notice that the "A" becomes "B"

Push the same BAND BUTTON again, one time,
and notice that the "B" becomes "C"

Push the same BAND BUTTON again, one time,
and notice that the "C" becomes "D"

Finally, push the same BAND BUTTON again, one time,
and now the "D" becomes "A" again.

These are the 4 different band registers and
allow you to preset the Orion for each band.

(Or think of this for each band, you actually
have 4 different "band positions" on the panel)

Each register will remember the frequency,
mode, etc. and it is quite handy to have.

Here I use "A" for CW
"B" for SSB
"C" for AM
"D" for RTTY <Digital>

Try it out ... it is a feature that was added in
the firmware since the manual was created, so the
details are not found in the current version.

I hope this helps, now go enjoy that Orion!

Hello Bernie

Tnx for the reply and the explanation.

What great flexibility!

Coming from a Jupiter this is new to me but easy to understand.

I did play with it while reading the manual when I first got the radio.

However, the old firmware didn't have the annunciators, or maybe it did

and I didn't notice them.

What a great radio.

73 Fernando N2FQ/6
Bernard Cohen wrote:
> This indicates which band stacking register you are on. Say, for example, you are on 20M. Push the 20M button. You will see the letters scroll to B, then C, then D, then back to A each time you push the button. In each of these registers you can set the frequency, mode, etc., and can return quickly to that particular band and mode. Say, for example, you set up your radio on 14.250, USB, with 2800 Hz bandwidth. You can push the 20M button, see a B on the screen, and set that up for 14.025 CW with 500 Hz bandwidth. To return quickly to SSB at 14.250, you push the 20M button three times, scroll though the C, D, and then back to A, which was previously set for 14.250 SSB at 2800 Hz. That way you can scroll quickly to up to four different band settings and modes by only pushing the 20M button instead of having to reset all of your band/mode settings. Have fun....Bernie K1SA

Tnx Billy for the details and example.. great help.

I've got figured out and great group here to boot.

Next stop is that contrast control adjustment under the

bottom cover. Spook the heck out of me when I

upgraded and the screen went blank. My 50% (default)

setting is a wash out.

It is normal ... this letter indicates the position of band stacking.
if you push several time the same band button (ex 14 mhz) you will see
four band stacking:

A B C D

in each band stack you can memorize mode and BW position.

Enjoy

Alex it9yhr

5638. Problem with main RX

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-17 19:40:11 UTC
From: Rob - G4LMW
Topic: 5638 Message: 5638

My receive audio in the main RX is virtually nil.

The second receiver is fine.

I checked the setting were the same on both. Eventually resorted to a master rest but still the same. It is as thought the front end has completely failed.

Anyone have any ideas?

Orion 1
Firmware v1.372

My 566 did the same thing on the main receiver. The sub receiver still worked ok.
Ten Tec found and replaced bad filters on the IF converter board.
I hope this helps

Chris

Thanks. Hopefully it will not be too expensive to fix. A call will be made to TT-UK (AOR) first thing on Monday.

Again, thanks for the tip-off. It might save some time with diagnostics (and therefore cost of repair!).

5648. Problem with main RX - SOLVED

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-18 20:43:21 UTC
From: Rob - G4LMW
Topic: 5648 Message: 5648

Rick (cc Orion reflector)

THANKS - you just indirectly saved me a fortune! .... I put the Orion back in situ and indeed, there were signals in the 1st IF. The next bit may seem ridiculous, given that (so far as I thought), I had looked at all the possibilities.....

Bear in mind that I operate 100% CW (except for the odd net and some club contests), so I never really have the BW wider than 400Hz. So, lo and behold, when I opened up the BW past 500Hz, wallop!... deafening signals. The Inrad 600Hz roofing filter had automatically selected.

I had a friend round yesterday and I was enthusing over the diversity of the wonderful TT Orion. I remember showing him where you could select the narrow filters. The trouble is, the 600Hz is the narrowest I have fitted.

Of course, the 2nd receiver was unaffected as the optional filters only apply to the main receiver.

My grateful thanks to all who offered advice and in particular to Rick, who pointed me in the right direction. I have changed the subject of this mail so that it might come up in a similar search for others

Now, to re-install the Orion back to its rightful place on the desk.....

Subject: Re: Orion RX?

I'm not sure on the self-repair Rob BUT you might be able to isolate it to the board level. If you can determine which board is the likely culprit you could ship off the board for repair / testing. In my case that saves a bundle in shipping to Ten-Tec and all the hassle of customs.

Perhaps in your case that isn't as big an issue with local support available in England.

Good luck!

Hi Rick

Ah....

Just dismantled the station, ready to box up the Orion. But, might just set it up again and check. The thing is, I think the last version I installed was 2.xxx and not sure if the sweep will work (not done the hardware change). Might have to go back to 1.xxx first.

I'm wondering if this is something I might be able to repair myself?

Just curious but are you seeing strong signals on the Orion's sweep? If you are that would suggest the signals are making it to the 9MHz IF board. To do this test I'd put the sub-RX on another band and then on a different antenna with a dummy load.

73,
Rick

From: Pumbaa
Topic: 5648 Message: 5650

Excellent! I am happy for you. I have all the filters installed on my Orion 2 but unless the QRM is bad I usually keep my BW about 1200 HZ. I like the sound quality better with the bandwidth opened up. But I like to rag chew or work stations working QRP. I am not much into fighting the QRM involved with DXing. When I first got my Orion there were several times that I thought the radio was broken but it was just me not knowing which button to push or which setting to adjust. A good reading of the operator's manual has helped a lot.

I been looking for a "previously owned" HF amplifier like the Centurion. Right now they are very hard to find. I am about to decide just to spend some extra bucks and get the new Ameritron ALS-1300 1200 Watt solid state amplifier.

I believe you have an cable for the Icom CIV interface which uses an 1/8 inch plug.
Some of the earlier Ten Tecs used CIV interface as well but your Orion use the RS232 interface so you need to get the proper cable for an Orion I.
You could build a CIV to RS232 adapter.

Just make sure both orion and your computer have a common ground to avoid burning the (sensitive) max232 chip within the orion logic board. Or perhaps use optocouplers between computer and orion... It breaks easily.

Again, I'm running 2.039d, DSP 2.06b14 and I've narrowed it down to just 20 meters. When you switch bands to 20 meters and begin to talk there is full audio on 20, after about 10 seconds the audio drops back to about 10%.

This is definitely a 20 meter problem on my Oii.

Odd. That's the reverse of what I'd expect. "Global" should apply the same setting to all bands. Maybe a Master Reset (or Battery Reset) is called for.

Hello Sam,

Suggestion to isolate the issue.

Did you try transmitting using CW on 20 Meter and does it show the same behavior?

Can you record voice message into one of the voice memories and run this to check if this provides other results?

With headphone connected to orion, do you notice the audio declining after the 10 seconds transmit while "monitor" is enabled?

Does the power always drop, even when running 50Watts or less?

Are you using ten-tec microphone or some third part microphone?

What does the ALC LED tell you? Does it always blink on peaks, even when you notice the output power going down?

On ALC LED, does it follow the expected peaks or is it more random behavior and sometimes even at times you dont expect ALC to show?

Perhaps this way we can isolate possible root cause.

Best regards,
Onno pa1ap

5655. New poll for orion565

Enter your vote today! A new poll has been created for the
orion565 group:

I would like to have a program which provides auto threshold function;

"background: through experimenting with AGC threshold a script routine has been build which takes the signal samples and then sets threshold value just above the maximum, average or minimal signal values.
This has provided some really nice results and demonstrates the effect of setting threshold correctly"

o yes, running windows
o yes, running linux
o no, don't see any value for it
o no, don't have computer connected to rig

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=12954790

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups

Does anyone know the part number for the 2 pin molex DC power connector?
Perhaps a Mouser part number?

I would order one from Ten Tec but they will not ship via USPS (I have a overseas military APO address and can only recieve mail via USPS).

I will be off the air until I get this elusive connector... :-/

(I now have a $4000 radio that is non operational due to a 99 cent piece of unobtanium...)

Thanks,

Marc, WC1X, 4Z8BB

For sale: Ten-Tec Jupiter 538 AT with 302J Encoder Keypad and 705 microphone. Rig has been modified my Ten-Tec with the digital IF signal routed to the "spare" connector on the back for DRM reception. Rig has Jupiter MP538K chip kit for changing the display to copy and send CW as well as a PC keyboard (non-Ten-Tec). Price $1,400 plus shipping. I live in The Villages, FL which is located at the juncture of I75 and the Florida turnpike in central Florida.

ok, thanks for riding along with me on this and all the suggestions.
I called TT today and spoke to Paul, he felt the only problem would be in the software so he had me do a master reset and settings reset.

I really hated to do that (last resort) as my settings would be lost however that is what I did and the low audio problems went away. So for now, all is ok.

Thanks everyone for your help and suggestions.

ok, thanks for riding along with me on this and all the suggestions.
I called TT today and spoke to Paul, he felt the only problem would be in the software so he had me do a master reset and settings reset.

I really hated to do that (last resort) as my settings would be lost however that is what I did and the low audio problems went away. So for now, all is ok.

Thanks everyone for your help and suggestions.

73,
Sam

Hello Sam,

Suggestion to isolate the issue.

Did you try transmitting using CW on 20 Meter and does it show the same behavior?

Can you record voice message into one of the voice memories and run this to check if this provides other results?

With headphone connected to orion, do you notice the audio declining after the 10 seconds transmit while "monitor" is enabled?

Does the power always drop, even when running 50Watts or less?

Are you using ten-tec microphone or some third part microphone?

What does the ALC LED tell you? Does it always blink on peaks, even when you notice the output power going down?

On ALC LED, does it follow the expected peaks or is it more random behavior and sometimes even at times you dont expect ALC to show?

Perhaps this way we can isolate possible root cause.

Best regards,
Onno pa1ap

I looked for Molex connectors just the other day on www.mouser.com . It was pretty easy to find them there with the part numbers, specs, etc.

Hope this helps.

Does anyone know the part number for the 2 pin molex DC power connector?
Perhaps a Mouser part number?

I would order one from Ten Tec but they will not ship via USPS (I have a overseas military APO address and can only recieve mail via USPS).

I will be off the air until I get this elusive connector... :-/

(I now have a $4000 radio that is non operational due to a 99 cent piece of unobtanium...)

Does the current roofing filter in the Orion-II second receiver meet the following characteristic?

Bandwidth 4000 Hz
Center Frequency 45.0000 MHz
Zin/Zout 50 ohms

If so, it should work providing:

Physically fits
Does not attenuate the signal

InRad has the listed the 902 as a filter for the Orion sub-RX (but as we see nobody has reported on, or perhaps even tried, this mod). The sub-RX is virtually an RX321 board. Unfortunately the Ten-Tec filter "45MONO" specs are difficult to obtain.

The stock 45MHz filter is likely MUCH wider than the InRad. However, without insertion loss and impedance of both filters this mod is a $125+ crap shoot.

Of course IF it works it would be a much needed improvement for the sub-RX.

Very true. Bear in mind that anyone serious about tackling this mod
should also replace the 15Khz wide 450Khz second i.f. ceramic filter.

Could you share motivation / background for changing the 455Khz filter as well? Replacing the first "roofing" filter w(c)ould provide better close signal selectivity, what would the second filter provide?

First filter might have more passband attenuation but I dont see that as a big issue.. DX I will use the main rx anyway, split and contest the sub goes to the crowd where it would be chaos anyway :-) Then a little more selectivity on sub would keep the sub rx a little cleaner?

Very interested on the topic!

As best as I can determine, the 450Khz filter is 15Khz wide (-6dB)
with 45dB ultimate rejection. If you're looking for better close
signal selectivity, these are not robust specifications.

Barry and I have talked about the 455 kHz filter (off list) before. Ten-Tec uses an LTW33-455D with the specs listed in Barry's note below.

An alternate narrower filter, the LTW33-455HT (in the same drop-in package), is also available:

-6dB bandwidth of 6 kHz
with 60 dB rejection
... and slightly higher impedance (2000 vs 1500 ohms)

Unfortunately the only North American on-line sources I've found have a minimum order of $250 or more.

So unless someone in Europe or Asia can find a local source at a more reasonable cost I've put this mod on hold.

Are you sure? You can get spurious mixing that produces "stations"
down there where there really are none. My quick tests of the 565
against an Icom R8500 shows that the Orion runs out of gas at the low
end of the BC band - 540 kHz. I wouldn't trust any results from lower
than that!

That's exactly what I'm afraid of, because it is not specs guaranteed down there.

Actually, based on the component markings, I believe the Orion subrx filter is an LTW33-450E with a 450Khz i.f. - if it were 455Khz, it would open up the possiblity of using a Collins mechanical filter as was done with the Omni VII. As Rick mentions, there is a HT version of the filter available as well as a narrower IT version (LTW33-450IT) with 4Khz bandwidth.

Thanks for this Barry but this gets more curious all the time?

The schematics for BOTH the 565 and 566 definitely say LTW33-455D but you found a model "E" 450 kHz filter?

However, the 565 manual (Page 57 of Rev 3 - Feb 2005) describes the Orion's sub-receiver as having 450 kHz IF.

So it looks like the Orion schematics are wrong.

That's never happened with Ten-Tec schematics before ;->>

>Re: experience with #902 inrad filter for sub receiver?
Actually, based on the component markings, I believe the Orion subrx filter is an LTW33-450E with a 450Khz i.f. - if it were 455Khz, it would open up the possiblity of using a Collins mechanical filter as was done with the Omni VII. As Rick mentions, there is a HT version of the filter available as well as a narrower IT version (LTW33-450IT) with 4Khz bandwidth.

****

All,

Here is a link to a .pdf file with the specifications of the LTW33-455 series of filters, giving bandwidths and two choices of impedance. http://www.hy-q.com.au/pdf/10120009.pdf Now which one would be the best to use for each application (SSB/CW/RTTY/PSK/General Purpose)?

5685. severe audio distortion with ANF engaged

Yahoo group: orion565 (2009 — 2013)
Date: 2009-10-27 15:58:02 UTC
From: Andrew B. Steen
Topic: 5685 Message: 5685

Good morning all. I have sent Tentec an email on this issue, but thought I would throw it out here as well. I am running the latest beta firmware in my Orion II, and with the small glitches that we all know about aside, it works OK. Recently, my Automatic Notch Filter became unusable. Even at a setting of 1, the ssb signal is so distorted as to be unreadable. It used to work fine, and I realize that there would be a small amount of distortion. Now it wipes out the audio. Anyone else experience this issue? I have done a master reset to no avail.

Well I'd be interested in trying the LTW33-450HT. This is a +/-3 kHz (6 kHz bandwidth) filter versus the stock filter with +/-7.5 kHz (15 kHz bandwidth). I think the HT would be a good compromise for all but FM.

The problem is finding a source that will sell small quantities. Typical minimum orders are $250 to $300 for suppliers I have contacted.

5690. Strange audio artifact

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-02 22:24:15 UTC
From: Larry Menzel
Topic: 5690 Message: 5690

Hi, All,

I'm writing on behalf of another O II user who's not on the reflector. He's got a late model Orion II with a TT microphone.

As he speaks, at the end of every break in audio out, there is a noticeable 'pop' or click. He's holding down the ppt bar while speaking. It's almost like what you'd expect if he were releasing the ppt switch after every word or group of words which he is not.

I helped him get the radio sounding good, but I recall this artifact at the time. I don't know what version of software he's running, but I'll recommend that he upgrade to the current version.

I checked all the usual settings, and all seem to be fine. He sounds excellent on the air, but there's this pop after words and thoughts within the transmission.

Hope this isn't too confusing the way I've stated it, but can any suggest something here?

Larry, W0PR

I had the same problem , Ten Tec diagnosed it as an oscillation in the mic amp circuit. Fortunately I was under warranty and they fixed. It is a known problem with the Orion2.

5693. Fldigi with Windows

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-06 23:35:26 UTC
From: ve7tk
Topic: 5693 Message: 5693

I decided to try the digital mode program Fldigi. Available at:

http://www.w1hkj.com/Fldigi.html

However, I've been unable to get my Orion 565 to talk to it? The setup has a configuration file for the Orion but so far no joy. The sound card is fine and the port/baud rate selected are correct. I've tried the program with my Argonaut V and it will at least connect.

Has anyone out there got their Orion working with Fldigi? Any insight would be appreciated.

Thanks.

Greetings,

I am running Fldigi including orion control and it works just fine. Frequency is copied into the program, confirming serial communication is working.

Could you share more background on your operating environment? such as operating system, sound card connection, rig control connection etc...

I am running Ubuntu 9.10 and fldigi 3.11.4. all connect through signalink USB controller / sound card. Serial port is connected directly to computer serial port, but besides the frequency it is not used for other purposes.

Thanks and best regards,
Onno

What Hamlib version are you using? There are known problems for the Orion in Hamlib before the last (very recent) release v 1.2.10. The Ubuntu repository version will be older. Please go to hamlib.org and get the latest version.

I have no troubles with fldigi on the Orion using the latest Hamlib.

Ten Tec Orion, Model 565AT (with built in antenna tuner) for sale.
This rig works perfectly and looks perfect . Ten Tec service department checked out the rig in 2007 and installed version 2 modifications and firmware 2.060b. It works flawlessly. I have used it on CW only at 50 watts and it has had VERY light use. It comes from a non-smoker environment and has always been covered when not in use.

The rig includes the 500 Hz and 250 Hz roofing filters plus the matching Ten Tec 708 desk microphone (never used). It comes with power cord, manual and original shipping box. I am selling it to fund some new more expensive toys.
The Price is $2100.00 including shipping CONUS..
Thanks, Hank, K5ICW

No Fred you are not the only one!! I had the same issue, key down and the rig would shut down. After someone suggested to look at the DC connector I found the pins where separating inside the connector and arching. After calling TT and hearing "they NEVER had this problem before"

What I did was take the connector off the board then "hard wire" a power supply line to the power supply board

No more problems with a 50 cent part on a $3K radio

Good luck

Fred -

I went through the same issue and power connector replacement. But, for me it turned out to be the fuse holder. One tab was not soldered and was intermittent under stress.

Got new part from Ten Tec. Replacement does not require more than taking off the bottom to get at the spot if you are careful about snaking the old part out and the new one in.

All,

The filter sets have arrived.

I have sent out paypal email notices to all the folks who emailed me about purchasing 'extra' sets I have. (The notice comes from BCA Software, the name of my paypal business acct. Check your 'spam' boxes, if you were looking for an email from WB2RHM.)

It looks like there will be 3 or 4 sets left. If you are interested in getting a set, I will send you a set (1-LT450GW and 1-LT450HTW) for $15.00/set + $5.00 for shipping, paypal works for me. Send me an email.

73,
Ben - WB2RHM

If it keeps happening, I will call TT and talk to them again To see if it would be better to solder the DC powerlines in direct...I want to talk to the tech anyway... Being from the old school (the last new rig I had was an OMNI C) I need more info on the Prorammable AGC and also on the PBT/BW setting. I must say though that the Orion II is one great rig.

As much as I love my O1 and appreciate the TT tech support, you'll probably hear " we don't know, we've never known a connector to go bad".....

From: ad4hk2004
Topic: 5656 Message: 5708

No, they will not say they have never heard of it...
My DC connector was bad right out of the box on a brand new radio... One phone call solved it and no problems for years now...
The tech will tell you to slightly crimp the female pins to grip better and to gently bend the male pins outboard so that there is a bit of wedging when plugged together...

Interesting. The way I hear that, the tech is admitting that the
power connector is substandard for this application. Having to tweak
the pins "just so" does not inspire confidence!

There are a million possible power connectors out there, and the
designers went with ultra-cheap.

Sorry to bust anyones bubble but TT DID tell me they NEVER heard of that problem and they told others the same

From another email yesterday.....

"You were right about TT support...They never heard of anyone having a problem with the molex DC connection on the Orion... I had to tell them they must of heard something as I have had the problem before and several on the users on this group have had that same problem. He was surprised at my comment.........."

They have a great rig, my choice, but just a shame to use a 25 cent part when my $135 2m rig has a much better HD connector

All,

The last set of extra filters I had has been ordered/purchased.

Thanks you to all who responded. Now, to see just how they tighten-up the sub-rx reception, before and after installing a #902 roofing filter.

Interesting how different folks have different experiences... All I can reiterate is the guy that put my radio together knew immediately what was going on when I called to complain that a brand new radio, right out of the box radio suddenly went dead after less than 60 seconds and the fuses were good.. Inspection of the Molex proved him correct, the pins were a sloppy fit...
It would appear that quality control at Molex is not up to snuff...

I wish they (everyone including TenTec) would just switch everything to the Anderson Power Pole connectors. It's a very robust design with a long track record of reliable use.

It would also make things much simpler if you are trying to standardize your rigs for emergency use.

Hello.

I started looking into that area when I had

the covers off. I was doing the contrast (50% default) adjustment.

It looks like you can solder two pins into the existing wire holes and

then mount the power poles on these pins. I believe that the power

poles would stick out from the rear panel.

I saw this pin/power poles from this website. Scroll down some

and you'll see what I'm trying to say.

I've got a very nice Omni VII which I thoroughly enjoy, but have always been interested in getting into an Orion II. I've got a variety of accessories for the O7 and a couple of other radios that might fit someone's idea of a good trade. Of course I won't trade all of this for an Orion II, but the right combination might work for someone. So here goes, if you are interested in a discussion, please contact me off list.

Omni VII, 300 and 500 hz filters, desk mike, SignaLink USB interface
for digital, 610 USB keyer.

RX320D used with N4PY interface with the Omni (or stand alone) for dual RX.

IC-7000 w/Z11-Pro Tuner, mounted in a Tac-Comm carrier.

IC-703 mounted in a Tac-Comm carrier.

VX-150 HT

Yaesu FTM-10R mobile

From: wb2rhm
Topic: 5656 Message: 5718

FYI-

While I love the performance of my Orion.....

The thing that disturbs me the most about the DC connector problem, (and before I looked into it, I had replaced the 'stock' parts 4 times), is that for years Ten Tec advertised "100% Key Down operation" when the optional fan unit was purchased and attached to the heat sink on the rear of the 565 and they supplied a DC power cable (and a replacement connector and pins).

Well, if you read the specs for the 565 you will see:

"The ORION transceiver requires a source of
well-filtered and regulated DC voltage. The
supply voltage can range from +12.8 to
+15.0 Vdc but +13.8 Vdc is the optimum
value. The voltage source must be capable
of supplying 22 amperes continuous duty.
We recommend using the included DC
power cable (P/N 86095). We have also
included spare connector pins (P/N 41020)
and a spare 2 pin power connector shell
(P/N 35165) for building your own cable.
The power supply plug will attach in only
one direction to the polarized two-pin DC
connector on ORION's rear panel. Use no
less than #14 gauge (#12 recommended)
stranded wires for three-foot long
connections to accommodate the required
current demand during transmit. Use
heavier gauge wire for longer power supply
leads."

BUT, if you read the Tyco/AMP Mate-and-Lock specs for the socket, plug, and pins..... (Tyco documents 108-1031 and 114-1010 and 108□1053). You will see 15 amps max current capacity for normal product use on the socket and the plug, and 20 amps at product absolute limit of 221 degrees temperature for the plug. Note that that 20 amps max is only 90% of the specified Power Supply minimum constant DC current requirement. No safety factor margin here.

Is this sloppy engineering, bad engineering, or unsafe engineering?

Now, for example, if you are a high duty cycle mode operator, and I am a RTTY contester and RTTY is almost 100% duty cycle under contest conditions.... the pins overheat and then the housing overheats and that leads to total connector failure over time.....

I have been told that the connector, pins, and socket are specified correctly..... I don't think so!

I have removed them all and run #14 wire directly from Power pole connectors to the PC board. Haven't had a problem since.

73,

Ben - WB2RHM

5721. TenTec Power Supplies FS

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-22 22:39:54 UTC
From: Ken Simpson, W8EK
Topic: 5721 Message: 5721

TenTec Power supplies for sale:

TenTec Model 280 power supply, 20 amps at 13 V DC.

This supply is quite heavy duty electrically.
It has 2 pass transistors, instead of the one that
some have. It also has an ammeter on it.

This one works fine, and looks OK as well.
A previous owner removed the molded in TenTec power
cable on the back and added very heavy binding posts,
so that it can be used with many different rigs and
not just TenTec. It also has a couple RCA jacks for
lower power use.

With paper work for $100.

"Switcher / 25" 25 amp switching power supply
This is a 25 amp switching power supply in a case that
matches the early Omni series case, with the metal bezel
around it. It is in a case that is the same size as a 243
remote VFO. It has an ammeter on the front, along with
Switch, TenTec logo, and output bulb. The front panel
basically looks like a 280 power supply with a metal bezel,
but says "Switcher/25" on it. It is very quiet, and well
shielded, and does not produce any electrical noise that
I could find. $150

Prices do not include shipping from Florida.

Thanks.

When a program reaches a certain complex level it becomes impossible to ever get all the bugs out of it. Example Microsoft OS.

Given enough time, some user will always find some combination of events that will find a bug. I don't have any real problems with the software that came with my Orion 2. So I don't plan to fix what is not broken.

But I am happy with Windows Vista. It finally works pretty well. I did however switch from Microsoft Money to Quicken. After Microsoft decided to no longer sell Money it quickly started crashing on me. So I was happy to get rid of it.

Well--- I loaded and used the 2.041XT Beta Firmware for some time. In
fact until about 10 days ago.
I went back to the previous version because I missed the calibrated
scale on the band scope.
I also did not see any value to the waterfall display and the AF AGC was
a joke.

If they update the Beta firmware I will try it and see if they have
added anything worthwhile.

The only qualified party who knows the answer to your question is Ten-tec.

I might be the only one but I would appreciate a properly working general available version instead of a beta version.....

Looks like it was about 2 years from the previous release to the current beta release, so I suspect it will probably be at least that long before another release.

Ten-Tec would be so much better off addressing the simpler bugs immediately and the more complex ones in a reasonable amount of time, than waiting until the list grows too much. Then it becomes a major project with the potential of even more bugs being introduced.

It would also be more prudent to stop making "Flash-ROM Updatable" a selling point, since you have to have an update to actually use the feature.

I have an Orion 1 with the ported beta that has issues that should have been addressed immediately.

While it may not be cost effective for them to add features, improve DSP algorithms, etc, there is no real excuse for the interface and basic advertised functions to still have bugs.

Just my opinion however.

Me, too. But realize that the "beta" tag doesn't mean too much for limited circulation software like the Orion firmware. You could easily say that all releases we've ever had have been "beta".

The traditional beta version is software put out there for the bleeding edge users who can help with the final debugging work. Then, after a *modest* interval, the production version is to be released for general use. But nowadays, "beta" is often just a weasel word meaning "don't expect too much from this release", with no assurance of anything better to come.

The Orion firmware is highly functional, but it still has its rough edges. Some things will improve, but some things won't. After purchase, we have to rely on free TT support. The pity is that, in the closed software model, the motivated users can't contribute to the improvement process except by complaining.

Cheers, 73, and happy Thanksgiving,

Martin AA6E

5729. Orion 565 "Fix-It" List

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-24 16:56:56 UTC
From: Rick W
Topic: 5729 Message: 5729

With all this discussion on the Orion II (566) "Fix-It" what about the original Orion.

I used the last Beta firmware 2.063xG for a brief period and, like many others, sent bug reports to ditsnbits. So perhaps it is time to assemble a "Fix-it" list for the Orion 565!

I'll be happy to coordinate the list if needed.

Here's a list - gleaned from the reflectors.

1)

When the AGC is changed from RF AGC to AF AGC
(or vice versa) the Orion serial port shuts down. A reboot of the Orion
eliminates this problem.

2)

When using the AF AGC the audio almost
disappears completely when the NR is engaged at any level -- even a
"1" will cause the problem. On my Orion the volume at MAX level gives
only very weak audio.

3) Loud pops in the audio when in AF/AGC with the decay rate set to anything other than 1000 dB/s

4) The sweep now has a fixed bandwidth and it is not as useful as past firmware versions.

5) The sweep display's "bandwidth frequency tick marks" are missing.

If there are other substantive issues to add to this list please drop me an email.

            ve7tk at yahoo dot ca

Thanks.

73,

Rick

Thanks for the effort Rick.

Yes, please add this one:

The filter blowby in the subreceiver dsp filtering is significantly
worse in 2.063xG than in v1.373

Hi Rick,

One thing that apparently didn't get fixed as previously thought is the "Red Screen" where the sweep portion turns red and ends up as a combination of both the water fall and normal sweep functions. I spoke with Ten Tec and they know the problem still exists. From what I have been reading here is sounds like the best thing to do is go back to the last non Beta version to get a stable screen and the display with frequency hash marks. The curser is about the only thing that I would miss.

73
Tony - W9JXN

PS: I also like the brown screen (3) which isn't quite as brightly colored but for some reason unlike the other color combinations, the sub receiver frequency is brighter than the primary frequency. Picky but annoying non the less since your eyes are drawn to the sub receiver frequency.

You might be correct that pretty much allreleases we have ever had, have been beta and indeed it claimed high functionality.

If one honestly checks the list of the claimed functionality and provides either working or broken status to each function, I fear we might have more broken functions then we like to see.

The lack of a structured feedback interface to Ten-tec makes them blind/deaf about our observations / experiences. I discussed with Gary a while back but then he retired and the doors closed again.

We could organize as a community, we could use the embedded trouble ticketing system within yahoo groups (its free and available)...This way we can actually build a community wide view on issues as found and help Ten-tec to understand the issues at hand in one view...

It has been suggested, an example has been build and I'm waiting for the group moderators to approve / accept.

Perhaps I'm the only one, but I did not buy the ORION under the agreement being a test engineer of any kind. I would really appreciate if it just works as promissed....

Rick,

In regard to the items 4) The sweep now has a fixed bandwidth and it is not as useful as past firmware versions and 5) The sweep displays "bandwidth frequency tick marks" are missing I would be happy with a fixed bandwidth that meant something. I think +/- 20 KHz with 1 KHz tick marks would be be a good compromise.

Also, as far as I am concerned they can get rid of the AF AGC altogether and also loose the red hanging
signal decay and improve the audio quality.

Another thing that bugs me is the lack of fine control on some of the functions on the Multi Knob.
For example, when setting the AGC Threshold it is vary erratic and jumps from 38.3 uV to 191.48 uV.
Below 10 uV it is very smooth but then it jumps in large increments. I realize all the values in between may not really be necessary but I think it should allow a wider range. I have also experienced intermittent operation
of the Multi Knob similar to what was reported in the O-1 for , I believe, the RIT. It can generally be
curred by pressing on the case on the right side of the display window on the curved edge leading down to
the screen. Must be a bad connection but, so far I have not found which set of connectors it is.
A number of the functions controlled by encoders seem to be erratic and jumpy.

Well that's my 2-cents worth for now.

73 and Happy Thanksgiving,

Jim K4DLI

I do not usually post to this reflector, just follow the debates. I have an Orion 1 and Orion 2. The first uses the last version 1 (1.373b) the second uses the latest 2 beta.
They are great radios, simply the best receivers I have ever driven.
Yes, they require a high level of learning and skill to operate them effectively but if you put in the effort the rewards are amazing!
The latest beta has a waterfall display which is many times more powerful during operation than is the previous amplitude sweep. I would now hate to be without the waterfall, I leave it on all the time as opposed to the sweep which I have never used.

The audio AGC seems to have been an experiment that for the moment has not worked, so don't use it! There seems to have been no real reason to provide this,of course that is never true in a commercial company so there was a reason which at present is not obvious.
The rest of the "fix its" are trivial.

I suggest that some of you get on and spend more time operating the radio and less doing engineering analysis. If you really want to get into the engineering analysis apply for a job at Ten Tec!

As was once said by Oscar Wilde - "I always pass on good advice it is so rarely of use to oneself"

I am more than happy with the excellent radios that I have in my shack.
I have operated all the other latest radios and only the k3 comes close.

I am posting this on the basis that those with a negative attitude are more likely to write than those of us who are satisfied. This is to provide some balance.

5738. Trouble with aux input

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-25 15:10:05 UTC
From: Stan
Topic: 5738 Message: 5738

I am unable to operate digital modes because the aux input on my Orion is apparently not working. I have traced transmit audio from the computer through my SignaLink USB interface and its cable right to the aux input on the back of the Orion. The ptt works fine and keys up the Orion, but no transmit signal. The Orion was just in Sevierville last month and they checked alignment and operation (although I wonder if they check the aux input as a standard part of their routine). On the SSB menu I have set the TX audio source to AUX and have adjusted the Aux Input Gain all the way up to 100, but still no transmit. Am I overlooking something that would prevent the Orion from transmitting (yes the transmitter is turned on in the TX menu)?

Thanks for any help,
Stan, W4AG

Stan have you doulbled checked the jumpers in the SL USB?? Also have you tried a MASTER RESET yet on the Orion? Amazing that needs it sometimes

BTW I have found that I only need my Aux Input Gain set to around 10 or 12 to work fine

Good Luck

John,

Yes, I have double- and triple-checked the jumpers. I even traced the transmit audio from the computer, through the SL USB and through the cable and connector that plugs into the Orion, and there is audio there. I will try the master reset before shipping it back to Sevierville. Thanks for the info on the Aux Gain; I'll start it out there if and when I ever get it working.

Happy Thanksgiving,
Stan, W4AG

Topic: 5738 Message: 5741

Stan:
I'm running the same setup. Had the same problem. It took days to figure it out. Checked & rechecked the settings on the radio.
It was the MENU settings of the volume controls in the puter.
I turned the volume up all the way , clicked the start button and got a bright red led .
I don't know why , but every time I go from normal computing to digital, that volume control in the menu has to be turned up, on my puter.
Hope this solves your problem , let us know.

5742. FS***Christmas Sale on my custom dust covers***

Yahoo group: orion565 (2009 — 2013)
Date: 2009-11-29 02:20:53 UTC
From: stan_clewett
Topic: 5742 Message: 5742

****PLEASE CONTACT ME DIRECTLY VIA MY WEBSITE OR EMAIL BELOW...I will NOT answer any questions here on the group***

Hi Gang.
It is that time of year again....CHRISTMAS time is fast approaching. I have my annual Christmas sale starting Monday Nov. 30th through Dec. 30th.
All my custom dust covers are 10% off and free shipping (free shipping for orders placed in the USA only) if you order 3 or more covers at a time.

I make covers for just about any and all radio equipment...amps,transmitters,receivers,etc....made from the 1930's to present. I also do custom covers for home brew equipment,etc.

Please visit my website: www. radiodustcovers .com for more info and pics,etc.

PLEASE email me with any questions at: stan @ radiodustcovers.com (remove the spaces around the @)

Happy Holidays to all!

Take care, Stan W6ON

Stan have you doulbled checked the jumpers in the SL USB?? Also have you tried a MASTER RESET yet on the Orion? Amazing that needs it sometimes

BTW I have found that I only need my Aux Input Gain set to around 10 or 12 to work fine

Good Luck

John

To: orion565@yahoogroups.com
Subject: [orion565] Trouble with aux input

I am unable to operate digital modes because the aux input on my Orion is apparently not working. I have traced transmit audio from the computer through my SignaLink USB interface and its cable right to the aux input on the back of the Orion. The ptt works fine and keys up the Orion, but no transmit signal. The Orion was just in Sevierville last month and they checked alignment and operation (although I wonder if they check the aux input as a standard part of their routine). On the SSB menu I have set the TX audio source to AUX and have adjusted the Aux Input Gain all the way up to 100, but still no transmit. Am I overlooking something that would prevent the Orion from transmitting (yes the transmitter is turned on in the TX menu)?

Thanks for any help,
Stan, W4AG

Greetings,

I noticed there are messages indicating that for orion 565 various hw modifications are performed by tentec. From recent FS messages: "power distribution, synthesizer and converter boards"...

Is there information available what those modifications contain / solve?

Thanks for advice,

Onno, pa1ap

I have three late model model HF rigs and this one is not getting enough air time to justify keeping it in the shack. Reward yourself with a great rig and accessories for Christmas. Ten Tec ORION II serial no. 10C107XX, it has the factory installed antenna tuner,excellent condition 9.9 out of 10, like new, non-smoker environment with all optional filters 1.8 600 300.Latest firmware installed. Optional Fan, 307B matching speaker 302 Remote Encoder and 963 power supply, factory box manual for the rig as shipped new. I will double box the accessories. The rig doesnt come from from the factory with a microphone so; to sweeten the deal, I will include a Heil PR-781 microphone with desk stand and because I'm in the Christmas spirit a Rigblaster Plug and Play interface that I have wired to use in CW mode exclusively (you can buy the accessory plug adapter from West Mountain Radio and work all the digital modes with it if you want). PayPal OK if you pay the 3% premium they charge me to use their service. I will accept the best reasonable offer over $3500. NO Trades and no sale outside of the continental United States. Buyer pays shipping. You can check out my feedback on under the user name of drdutch or under my callsign on qth.com. You will not be disappointed in this deal. Would prefer pickup in Pueblo, CO. Thanks for looking! Merry Christmas

Just want to make sure it isn't my rig. While running 1372 or 1373b5 I notice the output power varies a little while sending CW. Both build-in power meter as well external power meter confirms the output goes up and down a little during transmission, its almost like the signal is modulated with something. It happens at all pwr settings. When upgrading to release 2 this problem disappears.

Appreciate confirmation (or opposite)..

Thanks and regards,
Onno pa1ap

LOL. Ok, let me ask better then. Switch to CW, key the transmitter and watch the output power while sending continues CW signal. That should provide a constant carrier into the air, or am I wrong?

Thanks and regards,
Onno

I asked because I had the same problem with TX output power going up and down. But I also had RX signal strength doing the same thing. I thought there was a problem with an intermittent antenna connection but could find nothing. I moved to v2.04b and the problem seems to have gone away.

Ok Rob, now I understand. I got the impression you were making a joke on reading cw signals, sorry about that.

I don't have rx signal issue, just tx power varying a little when using 1372 / 1373b5. Indeed going to any release 2.x solves the tx issue. Appreciate if other 1.x users could check and confirm they observe the same to figure out if the rig is broken or not.

Best regards,
Onno pa1ap

5753. rf problem

Yahoo group: orion565 (2009 — 2013)
Date: 2009-12-06 13:22:43 UTC
From: Vince Santis
Topic: 5753 Message: 5753

Good morning,

I'm a visually impaired operator. I use a merlin CCTV to magnify print materiel. The CCTV is comprised of a camera and a tv or computer monitor mounted on a xy table. It is equipped with color display and zoom capability.

The problem is rf gets into the CCTv and shuts it down. After a period of time (days) it comes back . The radio is an Orion I and an MFJ solid state amplifier running about 400 watts. I'm on the second floor with no rf ground, will an artificial ground help? Is there another solution? TIAA

Hello Vince,

RF could get into the system through mains or simple cable rf pick up. Did you already include ferriet cores on all cables? (close to the unit)

Also, perhaps you could try to disconnect all cables, except mains and then transmit at full power. After transmit, reconnect all cables and see if the unit still works.

If it does, then rf likely entering through the other cables and the ferriet cores might do the trick.

If the unit is stuck, then rf is either entering directly into the unit or through mains. It might be worth to move the mains connector to another group to see if that helps.

My two cents, hope it helps,

Best regards,
Onno pa1ap

Ok, made the trade of my O7 for an Orion I, and do like the radio. But, still hankering for an OII. The OI I have is recently back from Ten Tec with software/hardware updates as well as the optional 1.8, 500 and 250 filters. Don't have cash for an exchange but have a really nice IC7K with Z-11 autotuner mounted in a Tec Comm carrier that might make up the difference. Anyway, if you have interest, please contact me off list.

Hello

I do have a like new IC7K with the plastic still on the display, new Head Remote Kit with an AH-4 tuner.

All accessories and original box, manual, etc.

I have a Jupiter then purchased the IC7K/with tuner.

Don't like the QSK relay chatter right off the bat, menu system a bit tricky.

Most annoying, can't see the display when sunlight hit it.

Now have a O1 and love it, kept the Jupiter and willing to let go of this IC7K which is sitting

in the closet.

Pictures on request. Total time on radio about two days worth. Never on VHF nor UHF.

It would be good to contact TenTec service, they will certainly be able to assist. They provide excellent service.

From what I have found myself, you could check the following;

Contrast is driven from the cpu through sending a PWM signal into the contrast potentiometer and then a capacitor acts at the integrator to arrive at a dc voltage. C700 is the capacitor. If you have the chance to measure with a oscilloscope the voltage on the potentiometer R702 you can check if there is indeed a dc voltage going to the LCD contrast pin.

If C700 is defective somehow, the PWM signal will remain as PWM which means the contrast voltage to the lcd screen is not correct.. Hence the "warm-up issue"...

Hope this helps,

Best regards,
Onno pa1ap

FYI;
On my orion, I learned the potentiometer (R702) had a bad contact and after replacing it my issue was fixed. I also replaced the capacitor (C700) at the same time.

Onno,

Thank you for the technical advice. Unfortunately, I do not have a oscilloscope. I m reluctant to send the Orion to Ten
Tec due to the costs but that is the only solution/option.

Regards,

Mike

hi all

have just aquired a orion 565 which is super
and a part built 6meter transverter mod 1208 but no paperwork or circuit
on 1208
ie what IF?? isuspect it is 14mhz as xtal is 36.000mhz
HAVE SERCHED TEN TEC SITE NO DETAIL THERE
can any one help with paper work or info on a possible site for info

many thanks

The Orion display problems (contrast change with warm-up, flicker, etc.) are often traced to a specific capacitor on the A9 board which is operating beyond its ratings and overheating. I had the problem and found directions for fixing it. After my "surgery", the display has been fine.

My experiences: http://blog.aa6e.net/2009/08/orion-surgery.html

5765. InRad 902 Filter - Orion Sub Rec'v Mod

Yahoo group: orion565 (2009 — 2013)
Date: 2009-12-12 16:21:20 UTC
From: Rick W
Topic: 5765 Message: 5765

I have recently installed an International Radio 902 filter in the sub-receiver of my Orion. I have written up the installation on my website for those interested. It is located in the "Ten-Tec Information" section under Orion Sub-Recv Mod.

As usual comments and suggestions are welcome.

Enjoy.

73,

Rick

Thanks very much for sharing and documenting the steps. It is not an easy modification to perform. Can you share some results about the outcome? How is the sub receiver handling big neighbor signals after the modification?

Thanks and regards,
Onno pa1ap

From: ve7tk
Topic: 5765 Message: 5767

Thanks for the feedback Onno.

Well my comments on the mod are VERY subjective. As you'd anticipate replacing a 2-pole 15 kHz wide 1st IF roofing filter with a 6-pole 4 to 5 kHz wide filter really helps.

However, there are still some images of the primary strong signal getting through. I found that an image of the test signal appeared within 2.5 kHz of a primary S9 +30 dB signal (sub-receiver in CW with a 900 Hz bandwidth and firmware 1.373b5). Some additional images appeared at 2.5 kHz intervals above and below this "phantom" signal. Both the modified and unmodified sub-receiver suffer from these self generated signals at 2.5 kHz intervals. In both cases the signals decrease in strength as you tune off the primary frequency. In the modified rig the number of images is significantly reduced.

I don't know the source of the 2.5 kHz mixed signal BUT it is definitely not present in the Orion's main receiver. Since these phantom signals occur at such precise intervals my thought is that the 2.5 kHz source is likely somewhere in the sub-receiver's digital circuitry.

I'll leave the tracking down of this source to others.

73,
Rick

5768. Main and sub RX on same ANT (1) resulting in 6dB loss?

Yahoo group: orion565 (2009 — 2013)
Date: 2009-12-13 20:54:10 UTC
From: pa1ap
Topic: 5768 Message: 5768

Greetings,

While searching over the top band I noticed by accident that switching the sub RX to ANT 2 instead of ANT1 pushes the band noise from S4 to little over S5 (Main is on ANT1).... Running 1372 (O 565) but I doubt this is caused by firmware. When AGC is off, its almost 2 S-points.

Anybody else noticed this? I guess when searching weak DX signals its best to switch SUB RX to ANT2 then? Any explanation what could cause this issue?

Thanks for advice,

Best regards Onno, pa1ap

5769. Strange problem

Yahoo group: orion565 (2009 — 2013)

From: Rob - G4LMW
Topic: 5769 Message: 5769

I found a small problem today after putting the sub receiver on MW (to listen to the football on the radio!).

Later on, after I sent some CW on the Main TX freq (it mattered not which band, the relay did not go back to RX. Very strange. I even tried with no RF but still the same. As soon as I put the sub receiver on a higher frequency, the problem went away!

Running O1, v 2.04b7 with hardware mod.

Oh, the other thing I should have added was that it was only the headphone audio that did not return. Un-plug the headphones and audio through speaker, plug them back in, no audio. However, could hear side-tone perfectly well.

As I said, it was as if some relay had not changed over.....

Hi Onno

Thought I could not re-create it. Then managed it (step 4 was the reason I could not re-create it).

1. Set VFO A on any amateur band, CW mode.

2. Set RF power to zero (safer that way!)

3. Set VFO B to 909 (VFOB ENTER/00909/VFOB ENTER

4. Set VFO B to AM mode (doesn't have the problem in any other mode).

5. Key down

Audio does not return to headset, but is there (on speaker) when headset removed

Just realised that I can reverse the problem by selecting another mode on VFO B then key down.. audio returns.

Very odd !!

Sharing an antenna between both receivers means 3dB loss in each rx.

I find no difference between ANT1 and ANT2 on my subrx if main rx is
not connected to either one.

I noticed recently that while listening on 80m SSB I could receive a station on two fequencies 14 kHz apart. Both signals were of a similar strength.The same happend that when I tried another station.
At this stage I did not investigate this problem further, by changing bands,filters, etc.

Has someone made s similar observation?

The subreceiver has a weak image at roughly 4kc offset from strong signals (which drives me bananas in weak signal dxing) I have not noticed anything at 14kc on either receiver...
Likely you have something in the set up that is causing problems... I agree with the suggestion to do a hard reset - and when doing it agree with wiping everything it asks you to save or wipe, i.e. turn it into a blithering idiot...
Turn off all front panel signal processing (i.e. do not turn on)any noise blanking, noise limiters, narrow the filters, or anything else, just leave the receiver at factory settings...
Then put the subreceiver on VFO-B, on a different band, and on the #2 antenna jack with no antenna plugged in, and mute the audio, and no antenna on the AUX input jack (Beverage)...
Finally, tune the main receiver and see if you still find those images at 14 kc...
Let us know...

I have considered the same but found the connector is mounted to a pcb, hence it would require a mechanical change. Perhaps someone found another way / solution for this, it would be nice to change this connector for something more reliable, especially on grounding....

Best regards,
Onno

Greetings,

I have the first beta program available and would appreciate a couple of test drivers. Program is for windows (visual interface) and I am assuming firmware 1372 on the orion. Right now it does RF Gain and Threshold together. Use and testing at your own risk.... Please send me a personal message with your email and I will email the installation file. It will install under windows and can be uninstalled same way... At least that is how it should work...

Best regards,

Onno, pa1ap

Onno:
Great news, BUT, I'm running the Orion II. Don't
know if your program will work
with it.
What say?

The first version is taking an easy approach but does depend on the reference taken by the firmware on RF Gain (predictable) as well Threshold (unpredictable).

Long story short: the unknown.... Given a desired signal strength, how much can you turn down RF Gain without impacting levelled audio output? Second, given desired signal strength, how much can you turn up Threshold without impacting levelled audio output?

Some details running 1372 firmware:

Through measurement (using RF generator and sound card) I have determined the threshold knee for signals between S2 and S7. Second I have introduced RF Gain reduction, throttling it down until it impacted levelled audio... In other words, tweaking Threshold up as well tweaking RF Gain down up to the point it starts impacting the desired signal.

I have a manual version where the operator can just click on signal strength (look at the s meter) and then orion main rx adjusts right away. It also includes buttons for attn, since in many cases the orion is to sensitive to my likings as well to drop down the signal into the higher resolution area of the threshold area.

One can also use threshold independently and keep RF Gain at 100%. Then Attn needs to be used, much more then you would expect at first... But recordings confirm that although total audio presence goes down, desired signal stays levelled... At first I thought the desired signal level went down too but this is just perception and audio analysis clearly shows the desired signal being processed by AGC to levelled output... It just sounds much more silent... I guess thats what we want?

But caution, miracles do not exist.. If undesired and desired signal are close to each other, nothing will improve that situation... Its questionable if 3-6dB difference will be big enough to hear.. But if undesired and desired are more then 1 or 2 S points away, then you can really improve audio presence by tweaking threshold, attn and rf gain... The windows application allows you very quick change to play with the settings... It might help.

Best regards,
Onno pa1ap

5791. Orion II for sale

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-05 21:12:53 UTC
From: wc1x@arrl.net
Topic: 5791 Message: 5791

I have for sale a Orion II (no antenna tuner) with all 3 optional roofing filters, matching speaker, encoder/keypad, fan, manuals and boxes. I am the original owner. The unit is in excellant condition and has been very well taken care of. It's been in a smoke free envirnoment and covered when not in use. I will take photos this weekend and make them available off list. Anyone interested can contact me off the list with an offer.

Marc, WC1X

5792. Orion 565 - Problem with audio with version 2.062a firmware loaded

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-07 17:41:01 UTC
From: rc143dr
Topic: 5792 Message: 5792

Hello All,

I am having an audio issue with version 2.062a of the firmware.

On SSB receive on voice peaks there is a rasping/buzzing sound like when there is overload on the ADC. It shows up in the speaker, headphones and aux out audio to my computer's sound card. The problem does not seem to occur while listeming to CW.

The rig is grounded. I've tried it with a linear power supply. I've also tried it with the computer off. I tried all this in case there was some other source entering into the receive chain to cause this noise. None of these things made any difference.

It can be eliminated by turning down the RF gain to a really low value to limit the signal peak level to the ADC. No adjustments of the AGC seems to help eliminate it. In fact it seems like the AGC hardly functions under 2.062a at any setting, in my opinion. If you lock on a strong broadcast station with QSB on 40 meters you can really hear the AGC action working under 1.372, but it was hard to observe under 2.062a.

Under 1.372 the receive audio does not show this issue unless I were to turn off the AGC with the RF gain at 100% on a strong signal or it somewhat sounds the same if I turn the AGC decay rate to its maximum.

The receiver sounds beautiful under 1.372, but under 2.062a it is nearly impossible to get satifactory audio on SSB without practically muting the receiver via the RF gain.

I have read all the posts about firmware revisions and know that the differences have been hashed out quite a bit on here. I simply want to know if what I am experiencing is "normal" for some orion 565s.

There are improvements in 2.062a that I clearly desire to take advantage of (stability of the operating system, better display, etc.), but giving up the receiver performance that 1.372 affords is a big thing to have to sacrifice for a stable OS!-)

The distribution of gain and operation of the RF gain control is clearly described in the last release of the manual; Ten Tec, however, never seems to have described how the system works (or doesn't) under version 2 of the firmware. I assumed that meant it was basically the same, but the behavior of my radio leads me to doubt that. (One could assume that the Orion II (566) manual would have been edited had the systems operation been changed and as I recall it is the same as version 1 of the Orion I (565) description, but I could be wrong here.)

Any insight or suggestions are welcome. (I do know you cannot run the Orion with the RF gain wide open under any version of the firmware, but under 1.372 you can almost get away with it under certain band conditions;-)Thanks for taking the time to help.

73,

Roger (N3AYY)

Its unfortunately a known issue. Try 2056 which provides cleaner sound. The latest 2 beta does an ok job when using Af agc. Or go back to 1372 as an alternative.

Thanks for the Advice!

I tried 2.056 and the issue is gone; sounds great on SSB now and the AGC works as it should.

I was looking through the firmware revision some and I am wondering if the AGC modification to desense the AGC to short pops is the culprit here?

I am wondering if the reason not everyone sees the issue is related to the type of noise present in their locality?

I'd like to investigate this further.

Hi Onno, happy new year!

The one issue i find still after alot of testing over many months (and your help awhile back) is that the Beta version on AF AGC shows alot lower S meter readings than 1.372 or 2.056. Not as good with distortion on the audio but i can deal with it. The decay rate for AGC in this beta mode is also limited to about 10db before popping starts. Annoying.

I swapped over last night from Beta to both the 1372 and 2056 because my DX reports were way off after two big nights on air. I am seeing most european stations here on my setup (20m) between S3 to S5 and occasionally S6-S7 when strong. All the local chaps around me are getting S6 - S7 and when strong, S9's. As do my other rigs. Even though this is just an S meter, it is very frustrating that the Orion is so far off with this simple visual tool for basic report use - its very very annoying. I have many rigs, none of which have this issue and all are very consistently within an S point of each other. Close enough for a rough report.

The S meter issue i discussed with you months back disappears when i use the Beta version and it almost rests on zero with no Ant.. which you would expect. With 1372 and 2056 the meter sits high and moves around alot at about S2... if i narrow the BW to say 700 or lower, it drops. CW on 200Hz its almost zero. The mode should not dictate the reading on this visual tool... Grrr.

On a broader note, I just wish Ten Tec would finally release a comfortable version, with no distortion like 1.0372, good contrast like 2056, no S meter issue like the Beta version with an full AGC range that works without popping!! The other little tools that display on the screen are of far less use to me than these basic functions and its the one reason i would not buy a Ten Tec again until its sorted... no matter its ability. I have the same argument over my Range Rover.. i am tired of repairing little quirky things on it. After sometime, these nag at you heavily - despite the fact that its the best true off road 4WD on the market. This has no weight with me when i get computer warnings or airbag issues etc. I just want to drive it without getting flashed by the computer.

Dont get me wrong, i like the Orion. The RX is sensitive and the TX audio is awesome, but i have just as much fun on my KWM2 or the Kenwood 950SDX. All i want is the Orion to be without the quirky behaviour we are experiencing... and happy to trade off all the other things.

I think my point is that both my Rangie and the Orion try to do too
many things.

regards,

Dean (ZL1COB)

Onno you may have already answered this question but can your macro
program be used on the Orion II ??

Yes it can be used for both versions. We might have to tweak the values though but you can certainly test it. Best regards, Onno

5802. Re: Auto threshold program for Windows

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-12 07:58:54 UTC
From: pa1ap
Topic: 5788 Message: 5802

At the time I was running 1372 firmware.

In release 1 the threshold kneepoint is not visualized through the s-meter which makes it hard to adjust it to the correct value. The macro addresses this by pre-defined values. From what I know, release 2 firmware adjusts the s-meter to visualize the threshold kneepoint.

When time allows I will verify release 2 kneepoint and rf gain settings in the same way I have tried to arrive at optimum settings being used by the macro right now. I hope the values will be the same but I am not sure.

I have received several positive reactions on the program, also from orion 2 users. At the mimimum the program allows you to quickly compare "default operation"" with "tweaked operation".

A new version is planned which includes various improvements as well I am investigating if I can display the threshold knee points within XY plane, where X would be the s-meter values (and uV) and Y would be the audio presence and potential attenuation of undesired signal. Then below the X the "real-time" s-meter value would be displayed as a mutli color bar, indicating minimum, average and peak values. Then using the mouse, one can set the threshold / rf gain to the best operating area etc...

There were also questions about running multiple programs at the same time (logging, rig control etc) but only having one destination com port. There are various virtual port programs which can address this and we are testing a couple of shareware programs. With the virtual port software each application will get its own virtual com port and then the software will proxy the input / output towards the shared real port connecting to orion.

Disclaimer: I am not a windows programmer and I am sure many other people can do a better job. I am also not an expert on the orion and many other people will know much better how things should work. I hope the community chimes into the discussion to help each other enjoying the orion foundation.

Best regards,
onno pa1ap

5803. Firmware for O-II

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-13 16:35:59 UTC
From: Andrew B. Steen
Topic: 5803 Message: 5803

Just wondering if anyone has spoken to Ten-Tec regarding the final firmware upgrade. I gave up waiting and returned to the original that came with the radio (2.039d). The AF AGC doesn't cut it, and the waterfall is old news monochromatic. I like the radio, and I like the old sweep with the frequency markers. Other than the sweep being a little more blunt on the tips, I don't really notice any difference. Any comments or new info would be appreciated. I have not been able to get any info from Ten-Tec, so maybe someone here has an inside track.

73, Andrew K6STN

From: Rob - G4LMW
Topic: 5804 Message: 5804

I have an Orion I with firmware 2.063XG, which I am happy with.

Hardware mod for the Sweep is done.

I am now finding several new menu options (and some that have disappeared).

Is there a latest manual to cover these features?

Don't hold your breath Andrew. After 8 months of "Beta" testing I'm
afraid our position is behind the back burner.

I's sad if you think about it

Hi Rob,
I would be interested in any information you may have on the hardware mod for the sweep. I am experiencing some sweep problems with my Orion 565.

Nothing pure, Anthony. He is a mix of a newfoundlander and probably a
flat coated retriever. We adopted him from the local animal shelter as a
8 week old puppy.

One more reason to support the animal shelters...

5815. For Sale Orion 565 AT (LDG OT-11P) plus extras

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-18 02:37:49 UTC
From: rc143dr
Topic: 5815 Message: 5815

Hello I am offering my Orion 565 for sale:

Orion I (565), from a smoke-free shack, with the following extras: 1.8 SSB roofing filter, new style rubber grips on both vfo's, cooling fan, Model 302 Remote tuning Pod, 705 desk mic, matching 307 Ten Tec speaker, power cord, original manual, internal LDG antenna (OT-11P) made specifically for the Orion, and original box (for transceiver only). Has the version 2 sweep hardware update.

Cosmetically I did discover one slight scratch on the top right corner that had been touched up and a few light scratches on the bottom of the unit out of view that I hadn't noticed before.

I am asking $1975.00 includes shipping and insurance, CONUS only. USPS money order or PAYPAL.

If interested, please contact me off list.

Thanks for reading this and 73.

Roger (N3AYY)

5816. N4PY, SDR-IQ, CW Skimmer, Write Log, Rig Sync, Omni VII or Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-20 01:12:52 UTC
From: John
Topic: 5816 Message: 5816

I find some people are interested in knowing about what I have been doing in getting CW Skimmer in this case, to work with what was my Omni VII and is now my Orion II (works with both):

If you would like to use CW Skimmer with your Omni VII or Orion and have 48, 96 to 192 khz of bandwidth to view, you can do so with a SDR-IQ rcvr (recently reviewed in QST). You can tie in a logging program as well(I use WriteLog). The program that ties it all together is called RigSync and is referenced in CW Skimmer's content files on 3rd Party Programs. I use VSPE to emulate virtual ports.

This is the way it works. I use N4PY's radio program and its transfer file and 3rd Party logging utilities to run the radio. (Those directions are in N4PY's help files). I run WriteLog and following N4PY's directions tie that program to the radio program. I then start Skimmer, setting it up as described and for the SDR-IQ rcvr. Then I run the RigSync program, (directions to find that are in the CW help files) Once all programs are up and running I hit the button "Sync" and "Skim" in RigSync and every thing is tied together. So as you watch the Skimmer screen scroll and see all the CW signals, and its program shows the calls on the margin, you just click on either call or a signal on the screen and your computer and logging program go to that call and freq.

By the way, I use a computer lap top sound card, Creative Labs X-Fi for the SDR-IQ.

73, John

I just assumed he was feeding the SDR-IQ with an antenna and using it
in parallel with the rig.

Rob, you can use any antenna with SDR-IQ. I use the same antenna I use for the RX only port on the radio. I use a 99' end fed long wire (made of coax with shield and braid connected) for my RX antenna. SDR-IQ is pretty robust, but I am worried about induction back into the RX when I transmit, so I use an ICE products RF limiter and then an ICE RX antenna splitter. When I was running the N4PY mod for the RX-320, I used a splitter to share that antenna with the SDR-IQ. Hope this helps. SDR-IQ runs perfectly well on an independent antenna and does not require an IF out with the set up as described. 73, John

Thanks for the explanation John.

I struggle to get my head round all this new technology!!

5823. Autotuner on the ORION II

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-23 00:58:19 UTC
From: Kevin
Topic: 5823 Message: 5823

I recently purchased the this radio and decided to get the auto-tuner. I installed it today according to the instructions provided. After the master reset I attempted to test the auto-tuner. I started on a band that I knew had an SWR of about 4 to 1. I press the tune button and the radio started clicking and attempting to reduce the mismatch. After a few seconds it stated on the screen that it had a 1:1 SWR match. I looked at my external meter and it still
stated that it was 4:1. I double checked the instructions and verified that I followed them correctly. Anyone have any ideas on why this would happen?

Please help...

Topic: 5823 Message: 5824

Hi Kevin,

The internal tuner does not change the external SWR.

What it does is simply match that 4:1 SWR to the final
PA in the Orion II at the point just "inside" the rig
at the point where the tuner and the final PA connect.

The "screen reading" is on the rig side of the tuner, and
your "external meter" is on the output side of the tuner.

In summary, all is working there as it should, so have a
FB weekend and enjoy the new accessory to your Orion II.

Billy,

Thanks for the reply. I guess I was under the impression that like an external tuner after being manually tuned it would state a match of 1:1. But after thinking about it the antenna is always at the mismatch. The external and internal tuners a compensating. Thanks I guess it's been a long day.

Kevin,

I think you are still missing the point. Your SWR meter would have to be on the "rig side" of the tuner, even if you use an external tuner. If you use an external tuner, and put the SWR meter between the antenna and the tuner, it will still show the higher SWR. I think you can more or less trust the SWR indication on your Orion, since it is reading the SWR Between the PA and the internal ATU.

5827. 302R mode switch filter issue.

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-23 10:07:04 UTC
From: b.beard62
Topic: 5827 Message: 5827

Hi,
I am a new Orion 2 owner. Most of my questions are easy to figure out with a bit of reading but now I am stumped.
The radio has 2.041XT firmware loaded.
My: issue: is as follows; when I change modes from the front panel the filter settings follow the settings last used on that mode. Example, 3000 bw LSB, 6000 bw AM, 1000 bw CW. when switching modes from the 302R the filters stay at the setting used on the band you started on. Example, CW bandwidth 500KHz switch to ssb using the remote and 500KHz follows. Ever try to listen to ssb filtered to 500KHz?
What am I missing?
Bruce

Dave,

No I get it. I realized after post Bills post that the SWR does not change on the antenna. Thanks for reply.

The best approach is to start using the bandstacking registers to change modes and bands. I set one up for CW, one for PSK, one for RTTY and one for SSB on each band and just hit the band button until I get what I'm looking for.

Earl,

If it is a Prolific chip set, there is a new set of drivers dated 11-24-09 on the Prolific website. It cured my problem.

The solution for many problems like yours is to look for new drivers. Most reputable manufacturers are putting out new drivers for Windows 7.

Hello

I am selling my ORION II with auto tuner to try another radio. Will probably regret it but enjoy trying different radios. It has the auto tuner, 1.8 filter, fan and speaker. Accessory bag complete and original packaging. The radio stays covered. The cover is included. I am the second owner of the transceiver. The radio is in excellent condition. I do not have the box for speaker. I purchased it from someone on QTH. I will be away for the next several days but will be glade to supply photos and serial number when I get back in. $2,800 shipped.

Thanks, Randy/N4JZY

Earl,

If you already have a USB to serial adapter, go to Device Manager in the control panel and see if it shows up as a Prolific chip set. If it does not recognize the USB adapter, plug it into an older PC with XP and see if it is the Prolific chip set. If it is, go to the Prolific web site and download the free driver for Windows 7. If you have a Belkins USB adapter as I have on my XP machine, Belkins is not writing a 64 bit driver for the model I have.

Prolific is the maker of the chips inside the USB to serial adapter. I hope this makes more sense.

73,

John

John,
I'm sorry but I just don't understand. I need a plug and play unit I can order. Ihave a Dell with windows 7 64bit.
Regards.
Earl,
K5FTE

You external meter is now the wrong side of the auto tuner so is
meaningless. If it has clicked and tuned and shows a good VSWR
(internally), it is working!

5839. Re: New file uploaded to orion565 (Orion AGC Macro)

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-27 12:54:52 UTC
From: pa1ap
Topic: 222 Message: 5839

Please note that usage is entirely at your own risk.

Following BETA testing with a couple of people (thank you all!), confirmed to be working fine on windows Xp & Vista but windows 7 is pending confirmation. I have now uploaded the AGC macro program to this forum.

Installation:
1) unzip the package and click on setup.exe
2) during installation it will check if all windows components are present and if not it will prompt you to download them. Installation of those components is required.
3) after the component installation / check the actual program will be installed (only 900Kbyte)
4) after program installed, it will start. It will also include a shortcut on your desktop as well create a program menu entry called pa1ap.

Usage:
1) after start, you will first need to connect to the orion. Upper left corner provides selection of the com ports, select the one you use and click on connect. If connection is correct, the CTS icon will turn green. If not, all buttons will remain grey as well CTS will turn red.
2) For general info, click on the Concepts tab for some background information. I have done my best to describe the mechanism as far as I understand it to work. If something is wrong, please comment!
3) Usage is very simple for the remainder of the functions within the AGC macro tab, below some general information;

GREEN AREA:
a) all buttons in the green area are connecting to the AGC prog mode
b) the macro buttons are nothing more then shortcuts to optimized RF Gain and Threshold values for a given S-meter reading on the main receiver. When you push one of them, you will see the Rf Gain & Threshold fields display those values
c) in case you want to exclude either threshold or rf gain from changing, unselect one of them (little select area above the display fields)
d) if you want to tweak the threshold value, click on plus / minus button. right now the program will not "remember" the tweak.
e) ATTN and Decay are also connecting to the AGC prog mode
f) click on Default RF Gain or Default Threshold and AGC prog will be put back to factory mode, except for Decay value.
g) depending on orion firmware, the default threshold value is 1 or 3. You can match the factory default value using the small numeric scroll window.

DARK GREY AREA:

a) all buttons in the dark grey area are connecting to the remaining AGC modes, such as fast, medium, slow and off
b) by default when you push one of the AGC modes, the program will return ATTN and RF Gain

to default. This allows quick comparison between AGC prog setting and factory default setting.
c) if you unselect them, ATTN and/or RF Gain will follow whatever the values are within AGC prog mode
d) you can also select Decay & Threshold to be put back to default again bu selecting the appropriate selectors

GENERAL USAGE, "you might notice":

1) that all buttons are grey when not connected to Orion, this is as designed
2) that all AGC prog buttons grey out (except for prog) when you select one of the other AGC buttons, this is as designed
3) that whatever button you push, this will be indicated by a yellow background
4) there is a Sliders tab which allows you to adjust RF Gain / Threshold very quickly. But only when you have clicked on the selector buttons at the right hand. Also, when you go back to AGC macro and click on any AGC button, the sliders will be made inactive again
5) there is a terminal window which allows playing around with serial command / buttons. Its there if you need it.

SCREEN SIZE:
1) default the program starts with full control window. Big and ugly, but it works.
2) Upper right corner there is a minimize button which will make it a lot smaller. Perhaps still ugly but it works.

VIDEO:
If you like to see/hear a video, do a search on youtube for pa1ap. You should find three video's which cover the original program.

COMMENTS / FEEDBACK:
Please share your experience with the group and possible improvements to be included in future. I am working on the next version which incorporates write & read functions as well automatic adjustments to AGC modes.

Thanks and best regards,
Onno, pa1ap

Onno, what version of Orion firmware does your software work best with?
What problem are you hoping to solve with the software?

I ask because I use v1.373b5 and simply adjust RF Gain and don't touch AGC Threshold (leave it at 1uV) - v1.372/1.373 firmware internally sets Threshold dynamically based on RF Gain setting and works quite well. I understand that v2 firmware requires more care in setting RF Gain and AGC.

5841. Re: New file uploaded to orion565 (Orion AGC Macro)

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-27 13:45:33 UTC
From: pa1ap
Topic: 222 Message: 5841

Hello Barry,

So far it has been tested on Orion 566 and 565 and it improved / simplified the user interface towards agc. Also tested on both firmware 1 and 2.

I have used the program on 1372 amongst other fw and find the combination of threshold and rf gain to be an enhancement. With just RF Gain I am not getting the same results, also when using 1372.

The program allows an easy comparison for the operator. You can quickly do an A/B test, include or exclude RF Gain / Threshold / ATTN etc.

The program does not (not do I) pretend to solve a problem within the Orion, it just allows the operator to have a friendly interface with s-meter associated macro buttons (as well some other options).

Hope above helps,

Best regards, Onno pa1ap

Bill,

Plug in the USB adapter to another USB Port. Go to Start and Right Click on My Computer. Click on Properties and then Device Manager. In Device manager, you will see Ports. Click on it and it will tell you the Port numbers assigned to the USB adapters. Then in your program, select the port number for the program. If you move the USB adapter to a different USB port, the port number will change.

73,

John

Or switch to Linux, plug it in and it just works!

Sorry, couldn't resist.

Martin,

Is Linux intelligent enough to know which USB adapter belongs to which program? Is the little Penguin inside the box doing your thinking for you? :-}

73,

John

Or switch to Linux, plug it in and it just works!

Sorry, couldn't resist.

A little trial and error goes a long way. The penguin normally comes up
with the same device address assignments each time, but you have to figure
out which is which - /dev/ttyUSB0, /dev/ttyUSB1 etc.

From: dwfearn1
Topic: 5849 Message: 5849

Orion 565 for sale.

Orion I s/n 10C10452 original owner, always in a non-smoking climate-controlled environment. Includes 500Hz filter, and LDG OT-11P internal autotuner. Hardware sweep mod, new style rubber rings on tuning knobs. Currently with 2062A firmware. Includes all original manuals and two power cords, and original shipping box. In excellent condition. I'm selling it because I was only on the air three times in the past year and it seems a shame for this wonderful rig to go unused.

$1900, which includes UPS ground shipping to CONUS.

Photos and full details at www.dwfearn.com/orion.html

5850. Using multiple programs on the same (physical) serial port

Yahoo group: orion565 (2009 — 2013)
Date: 2010-01-30 15:34:28 UTC
From: pa1ap
Topic: 5850 Message: 5850

Greetings,

I got a couple of questions about the challenge with any device which has only one physical serial port. With standard windows environment this means only one application / program can use this port.

When using logging programs, control programs and perhaps the small macro program at the same time this causes a conflikt during operations (windows does not allow multiple programs to claim the same physical port).

For this there are so called virtual serial port emulators which allow you to create a virtual serial port to be used by the logging programs etc. and this piece of software will proxy all read/write towards the real serial port.

This way you can use all programs at the same time, controlling the orion through serial port and not have a conflikt. One example can be found on
http://www.eterlogic.com/Products.VSPE.html

Its for free and works like a charm.

The procedure to use is simple;

1) when you have started the program, click on device
2) click on create
3) select "splitter"
4) pick a non existing virtual serial port, for example com10
5) select the real serial port (as example com1)
6) for real serial port click on settings and adjust baudrate etc. to match what the orion expects; 57600, DTR/RTS YES and then ok.
7) everything else as it is...

8) then start the emulation by clicking on the green "play button"
9) all programs / applications should now be directed to use com10 (the virtual port)

Thats all whats needed and It works excellent on my computer.

Hope this helps, best regards,
Onno pa1ap

This approach may work for your needs, but it may fail under certain conditions - eg, if the programs in question step on each other by issuing commands at almost the same time. You really need a software layer that "serializes" the access by allowing one command (typically sending a command and receiving a response) to complete before starting another. You need some intelligence there that knows what a complete rig exchange is supposed to look like.

On the other hand if you're just doing casual polling for your logger, etc., the chance of a collision is not too high -- and if there is an occasional glitch, generally no harm is done.

Hello Martin,

I understand your concerns and appreciate the model of hamlib and similar software layer approaches. My suggestion might not be as perfect but then again many things in life are less then perfect.

On the virtual port program;

It seems the proxy utilizes a source switch table and commands send by applications follow store and forward mechanism. After a command is forwarded a small delay is introduced before picking up the next command to be send. In case the orion returns information, the switch table will lock until no bytes are received anymore for a period of time. In case the orion would have a function which repeats transmision on its own towards an application this might brake the mechanism but this is not the case for orion. If the applications have a poll function, their commands will be stored prior to forwarding them and if the application has a watch dog mechanism, the application might time-out if there is a huge amount of stuff being stored (delayed) within the proxy.

No, the DSP is part of the whole firmware package. No one knows if,
when, or how likely a firmware upgrade will be released. However, the
guy who was writing the firmware recently left Ten-Tec but is supposedly
continuing to write software for Ten-Tec.

5859. Enhanced A>B VFO Copy function?

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-04 16:14:53 UTC
From: fullcity
Topic: 5859 Message: 5859

Hi folks,

Does anyone have any detail on exactly what is involved in this feature of 2.063XG, as noted on TT's 565 firmware history document?

It is the only thing that looks appealing to me about upgrading from 2.062. I hate how I can't save a split setup in Orion's memories, like I can on my Omni VI+ and TS-450S. (Not that I expect this is what they are describing)

Thanks for any information on this.

From: Eric Rosenberg
Topic: 5860 Message: 5860

I've been using WL 10.6x with my Orion and Hercules II amp operating in the QSK mode.

It turns out that WL is sending CW sooner than radio can transmit it. I'm clipping the first character.

What is the parameter to change this in Writelog, or do I need to change something in the Orion?

Any help is appreciated!

Thanks,

Eric W3DQ
Washington, DC

On threshold and RF Gain association this is interesting information.

Where did you find this confirmed?

If RF Gain is adjusted, threshold value is not changed from the operator point of view. Other way around it provides the same perception of independence. In case the 1.37x firmware does associate both but does not inform the operator about it, whats the use of having two controls and not just one?

Do you have information about the values used within this claimed RF Gain / Threshold association? Because interesting enough it confirms what I am trying to achieve using the macro's which combine threshold and RF Gain... If you have further information on those values that would be great!

Thanks and regards,
Onno pa1ap

Roger

I don't have any documentation, but can tell you what it does.....

A single push of the A>B button transfers the frequency and mode from A to B
but B retains its other settings (BW, PBT - same as before)

However, if you hold the A>B button (about 2 seconds) the BW and PBT
settings are also transferred.

AGC, RIT and RF gain settings are not transferred in either scenario.

B>A obviously does the same but in reverse!

Hope this helps.

> PBT settings are also transferred

Thanks Rob - this minor addition is likely the change! BW/PBT can be configured to copy over (or not) using one of the menu options in the earlier firmware. I guess they just made that feature something one can do on the fly.

I find the inability** to save a split operating setup to memory (VFO A and B, plus the split setting) a challenge on this rig. It's really easy to do on lots of older rigs. Since I do a lot of CW DXing with stations listening "up" it does cramp my style a bit!

Cheers -
Roger K2ER

**Yes, I know one can save each VFO to a separate memory location, but that involves numerous button twiddles.

I must admit that I am not sure why you would want to save a "split". I do plenty of CW DX chasing and invariably the split is constantly on the move. The "binaural" facility allows me to net onto the worked station and bingo!

If I had the facility to save a split to a memory, I am not sure I would use it!

"I must admit that I am not sure why you would want to save a split."

Rob,

Let's say I'm listening to a DX station on 14.004 and calling him around 14.005, slightly variable. But I get tired of not being heard and decide to tune around for a while, fully intending to come back soon. With other rigs I've used (TS-450S, Omni VI+), the entire VFO A/B and split mode setup is saved to a single memory location at the press of a button.

I can then switch to simplex, tune around as I please, use VFOs A *and* B as I wish... and then restore the whole dual VFO DX setup from above in one or two button presses.

I find that very useful indeed.

Anyway, this is one of those annoying areas where Ten-Tec omitted a feature from an older radio. There are a few of those on Orion that annoy me. :)

OK, I get you. Yes, makes sense and I guess that I would use it.

Have you tried asking for it to be added?

I haven't asked for anything! Since the firmware seems to be moribund, I assumed that nobody's pleas are being responded to these days. Is that not so? Do we have a viable contact at TT since Scott Robbins and the firmware programmer departed (double whammy)?

I have a few things I wish they'd fix from a UI perspective, some of which they've already got coded into older rigs (like Omni VI).

To be honest, I wasn't sure what the situation with firmware was. I knew
that Scott left a few month back.

I thought that the latest firmware was only a couple of months old?

> I thought that the latest firmware was only a couple of months old?

Unfortunately, the Orion 565 firmware revision history file on the TT website is dated May 14, 2009. So I assume that corresponds to 2.063Xg:

Version 2.063Xg - Beta
Enhanced SWEEP function with enlarged display and tuning cursor
User selectable RF or AF derived AGC
Optional Per-Band or Global MIC/PWR settings
Enhanced A>B VFO Copy function

Version 2.062a
Adjusted gains to correct overload when large +EQ was set and AGC was set for FLAT.
Corrected serial port VFO update routine resulting in display not being updated when changed.

For the ones interested I have uploaded a new version. It provides firmware profiles to be selected through the menu. Also the firmware profiles are stored in the "my documents" folder within windows and the file is flat asci file. Program always starts with SET1.

Right now the program provides tested 1372, 2056 and 2069XG (all orion 1) as well estimated for 2039d (orion 2). SET1, SET2, SET3 and SET4.

If you like the program to start with the orion 2 profile, open the agc_profile.txt file and change the name SET1 to SET4 AND SET4 to SET1... This way you swap the profiles.

All sets can be replaced with your own values of course. And if something goes wrong (file corrupted) the program will tell you and go back to a default set. To repair, just delete the agc_profile.txt file and start the program over again. It will detect the file is missing and will create a new file.

Anyway, for the ones using it I hope this provides quick and easy customization as well quick A/B comparison.

Best regards, Onno pa1ap

5874. 565 Orion - Low Output Question

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-09 17:00:49 UTC
From: n4dd
Topic: 5874 Message: 5874

Good Afternoon Guys,

I have a 565 Orion that is only putting out a few milliwatts of RF. I removed the radio from service, boxed it up, and took it to a friends home. When he hooked it up, he had no RF out. He has done the Master Reset, and even downloaded the Beta software, but no change in output. After the master reset, he even lost receive for a time. Yes, transmit has been turned on. The amp keying is off, if that matters. I have instructed him to do the Ram Clear, and then the Master reset clearing all filter settings. Is there anything obvious that I might be overlooking? Thanks,

Dennis N4DD

Dennis I have the same issue with my O1. My issues are the bandswitch relay according to Ten Tec.

I have not sent my back but when I power up there is no receive and no transmit. I have to change bands via the keypad and once the relays "click" I can go back to whatever band I want and all is good until the next time I let it sit off. Really don't know if it's a certain time off or not but almost everyday I turn it on I have to do the band switching routine

Just have not sent it back yet

Good luck

In TX menu:
transmitter on?
transverter off?

Tried both antenna ports?
What is the meter telling you? Does ALC light come on?
What modes? CW? SSB? (Check SSB menu: Tx Audio Source)

I gather receive is mostly normal?

Has anyone opened the rig for any mods? Possible problem reinstalling cables.

Of course the power amp could be shot. (If so, you should still get some transverter output if you turn that option on.)

That's all I have to suggest without getting hands on. Good luck!

I wonder if the firmware for the Orion 565 is going to be the same as the Jupiter issue? I have asked for years about the issue with the Jupiter locking up when you turn on the NB, AN and the NR at the same time. People at TEN-TEC say the same thing, " WE KNOW ABOUT IT AND WE ARE WORKING ON IT" I have asked about it back in 2002 or 2003. I guess they are real busy. But in there defense. Gerry and Tony are the best. Anytime I call they always make me feel as if I am the only customer. I have never got a radio back from service that didn't work correctly. I love TENTEC service department. Maybe things will get better now that Scott is gone. I have had more people tell me they will buy a Ten-Tec now he is gone.

I talked to Gary Barbour of TenTec today at the Orlando Hamcation. He told me that new firmware is coming out in the next couple of weeks. He said the display issues and AF AGC issues were being addressed, as well as a number of other things (that we didn't get into details about).

Topic: 222 Message: 5884

Greetings,

I have combined the orion firmware specific settings (stored in agc_profile_2.txt in my documents) with the slider bars. This shows very nicely how the values match the s-meter values.

Please keep in mind that one has to select the correct profile set to get best results. This is done by pushing the up/down scrollbutton at the top right area of the window. For Orion 2 we have SET4 as reference value and feedback has been positive.

Second, by default the Threshold & RF Gain values are connected and if one clicks on for example S4, both threshold and RF Gain value will be adjusted according to their S4 value as found in the agc_profile_2.txt file.

Of course, threshold and RF gain can also be adjusted independly by just dragging the sliders left and right.

Also the connection between Threshold and RF Gain can be "disconnected" by unselecting the connection line on the left.

Putting back Threshold or RF Gain to factory default can be done by clicking on the respective value field (light yellow) on the left of the window

By default the program will zoom into the area of S2 up to S7. You can change this by clicking on "FULL" which will change the sliders into full range settings.

Optional:
When you click on "SET" then another window opens. This windows allows you to change the queue delay as well the scrollbar sample rate/speed. If you find other values more useful, let me know and we can figure out a way to incorporate this. When debug is selected, the window will show the scheduler and the commands send to the orion. I have found this useful when programming and it also allowed me to finally create some work around for bugs as found in the orion firmware. The work around is called KTDT. I would keep AGC prog only selected, since the other agc modes do not allow full range to be adjusted and this might cause problems.

Work in progress:

I have made the window with some buttons such as ATTN (0/6/12/18dB), PREAMP, ATN1/2/RX, Include Sub AGC, AGC Mode (Fast, Med, Slow, PROG). I just need to go through the verification and such like.

Hope you will like the program!

Best regards,
Onno pa1ap

From: ke5otl
Topic: 5887 Message: 5887

I was trying to buy a used o2 from stan that came in for trade last week. I was told this model was going to someone for beta testing but I would be able to have it when he was finished testing the new software. I called today and was told that it would still be a couple of weeks before that radio came back to Ten Tec. They had another one without the AT so I had them install it in the one they had on the shelf. So it looks like they really might be testing for the new software.

5888. Orion AGC macro V2 program walk through video

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-16 18:53:22 UTC
From: pa1ap
Topic: 5888 Message: 5888

Based on discussions and feedback I have rewritten the program with a new user interface, more flexibility towards the various Orion firmwares as well an easy way to implement individual settings.

Individual settings are now stored within the "My Documents" folder and the text file is called agc_profile_2.txt. Here one can include own personal settings for the various buttons for easy usage.

The instruction video is about 15 minutes and can be found on youtube:

part 1: http://www.youtube.com/watch?v=BCw--mGwaYU

part 2: http://www.youtube.com/watch?v=1WgB9P9W3Gk

Have fun playing with the AGC & RF Gain settings.

Best regards,
Onno pa1ap

Some background if interested;

1) On orion 1 (565) I have finally found the reason for unpredictable AGC threshold settings. Perhaps it is a bug or my lack of understanding but if you want to program the threshold value you have to do the following sequence: RMAP (AGC prog mode) - RMAT10 (Threshold) - RMAP (AGC prog mode)..... If you do not include the last RMAP, the orion will not activate the new threshold value -although- the orion lcd tells you it is active... Same applies for RF Gain and other functions. It could be specific to a firmware version.

2) The program utilizes a queue and scheduler for commands to be send to the orion. If you want to send a set of commands, they will be put into a queue and then through a scheduler the queue will be emptied one by one. The scheduler empties the queue with an interval of 20ms and this time can be changed up to 901mS. The queue / scheduler makes the communication more reliable and allows the serial port to be shared with other programs when using a virtual port application.

3) The sliderbars utilize a sampler to avoid sending an update for each step up/down made by the slider. Without the sampler, moving the slider from 0 to 100 would result in 99 commands send to the orion... Not very nice. The sampler uses a timer (default of 100mS) which is started when you move the slider for the first time. During the timer no values will be read from the slider until the timer expires. When the timer expires, the slider value will be put into the queue... ready to be send to the orion... With the sampler, if you move from 0 100 within 100mS, only one value (100) will be send to the orion.

4) The program also provides a debug window (click on program) and after you enable debug you will see all communication to Orion and other program specific information. In case you have manipulated the agc_profile_2.txt file and made a mistake, you will find a message in the debug window informing you about possible causes.

I have been researching the Ten Tec offerings.
I really like the 566 but the price new is out of my reach, the price used is kind of a stretch also and there fore have been looking at the Orion I.
So I am posting this question to the group.
What am I missing out on by picking up a used Orion mod 565 and not a used Orion II? What avout the hardware fix needed on the Orion I I see mentioned in the used sales?

Are there any owners of both that can give a side by side?

My operating will be casual contesting, DX and some rag chewing..Both CW and SSB

tnx

Eric,
I had an Orion I and now I run an Orion II. Lighting took out my Orion I; or I may still be running it. The two radios are very, very close. The trick to making it a great receiver is to get the roofing filters - get as many as you can afford. For CW get the 500Hz first, and then the 250Hz, and then the 1000Hz. For SSB the 1.8 KHz filter is well worth while. The filters are pricy, so look on the internet for filters the Orion I; guys may have kept when they upgraded to an Orion II. The roofing filters for the two radios are not the same. The Orion II has 2 DSP processors, and the Orion I has one DSP processor. This results in faster respone time in the O II; but you will not notice it when running a O I. Then O1 has a little attenuation at the 500Hz filter, but they added an amplifier stage, and you can not see any difference. The Harware mod on the O I is to improve the sweep characteristics and run Version 2.xxx firmware. It is likely that most all the O Is have already modified. The mod is worthwhile.

Both radios are very good. When the Orion I came out there was a lot of complaining about the black & white display - so now the Orion II has a color display - that is the main difference.
Get an Orion I and after you learn to use it (it is not a novice radio) you will be very pleased. You get 100W and the best receiver made. The Orion I is more radio than other radios selling for about that price.

Good luck......Bert W5ZR

If price is a concern, than a used Orion I is by far the best choice.
Install the Inrad #762 600hz filter in place of the stock 1Khz filter
and ignore the 500/250hz filter slots.

Chances are that your used Orion I will already have the v2 hardware
mod. Personally, I never use the sweep display anyway and I wouldn't
be concerned if my Orion didn't have the mod. If you're truly
interested in a panadapter, a far better option would be to install
the VE7TK mod to add the 9Mhz i.f. output in conjunction with an
external LP-PAN device.

Sorry, but must disagree with this. First off, the 1000hz filter comes with the radio - it's not an option. The 500/250hz filters are not worthwhile because they're prone to increased IMD from the extra preamp stage - this was widely discussed previously. You'll get better close-in cw performance and save money by using the Inrad #762 600hz filter in the 1000hz filter slot. Several years of contesting and top band dx'ing on the Orion in the toughest condx proved to me that the 600hz filter is all the roofing filter you'll need on cw.

73,
Barry N1EU

The Orion I is a very fine radio. I would argue that additional roofing filters are really unnecessary unless you operate in a rather "hostile" environment (heavy contesting, especially). The stock filters work very well for me - working DX pileups and other somewhat competitive situations. So, don't be afraid to go with the stock filters and add others if you find you actually need them. Another item you may not need is the built-in antenna tuner. I have one, and I've almost never needed it. (I use a Heath SB-220 linear and SA-2060A tuner at times.)

Personally, I think used 565 is the best value. You get a fantastic radio at a really good price. Sure, there are some issues (as there are with any radio) but at the core you get a radio that will be the best radio you have ever owned (assuming you are replacing an older vintage radio).

The hardware fix is not hard to do, or you could just let TenTec do it. Even with the various firmware issues the radio still performs great, in my opinion.

Look at it this way: If my old buddy from LSU Electrical Engineering school back in 1959, Bert W5ZR, says it is a good radio then you can bank on it.

Personally, I think used 565 is the best value. You get a fantastic radio at a really good price. Sure, there are some issues (as there are with any radio) but at the core you get a radio that will be the best radio you have ever owned (assuming you are replacing an older vintage radio).

The hardware fix is not hard to do, or you could just let TenTec do it. Even with the various firmware issues the radio still performs great, in my opinion.

Look at it this way: If my old buddy from LSU Electrical Engineering school back in 1959, Bert W5ZR, says it is a good radio then you can bank on it.

Subject: [orion565] Orion vs Orion 2 looking weighing the difference - would like some input?

I have been researching the Ten Tec offerings.
I really like the 566 but the price new is out of my reach, the price used is kind of a stretch also and there fore have been looking at the Orion I.
So I am posting this question to the group.
What am I missing out on by picking up a used Orion mod 565 and not a used

Orion II? What avout the hardware fix needed on the Orion I I see mentioned in the used sales?

Are there any owners of both that can give a side by side?

My operating will be casual contesting, DX and some rag chewing..Both CW and SSB

tnx

Carl

Is this in all modes?
What ACTUALLY happens?
What happens when you press "TUNE"?
What does the "RF Power Out" (top left corner of display) say?

Well, I would be there if I could. We could trade school and Orion war stories!

At least you know to come to LA to have fun! I☐ll bet you learned that at Ole Miss.

Wes, I am an Ole Miss Rebel and I would certainly never bank on anything anyone from LSU ever said. Am heading to NOLA this weekend for a convention and will be holding court at Pat O'Brians from 1730-1900 Sat thru Wed to take on any challengers!! I'll be the guy wearing the Ten Tec hat. Drinks on

me!! 73!

5900. Trade Orion/LP-Pan for Omni VII

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-18 14:53:49 UTC
From: John Huffman
Topic: 5900 Message: 5900

I've enjoyed using one of the best transceivers ever made, but would like to set up a remote station and the Omni VII would be perfect.

Want to trade -
Have
Ten Tec Orion 1 (565) - Excellent condition, no issues.
Has Autotuner
Has 1000hz Ten Tec or 600hz Inrad filters, Ten Tec 1.8khz and 250hz filters
Has Clifton Labs Z10000 buffer amplifier that brings the 9mhz IF out to the "Spare" jack on the back of the Orion.
Has all updates for Version 2 firmware and is loaded with the latest beta Version 2.063XG
LP-Pan - Excellent condition, no issues
LP-Pan takes the 9mhz IF from the back panel and converts it into I and Q signals for a sound card.
To have the real-time, point and QSY PowerSDR panadapter you would need to add one of the recommended sound cards
http://www.telepostinc.com/soundcards.html
and free software.

Want
Ten Tec Omni VII with autotuner in excellent condition, no issues.

Please reply directly to hjohnc at gmail dot com

Thanks!

73 de K1ESE
John

Carl,

This idea is just a shot in the dark, but behind the buttons on the right hand side of the display is a row of connectors. There are long pins from the CPU board which is behind the LCD display that plug into the connectors. Press the slopping area between the display and the buttons. This will “exercise” the connectors and if things start working again, you have some oxidation on the pins. Good luck.

Don't remember the whole thread but I had my O1 apart once (rear panel off) and there's many jumper cables and one in particular that runs into the PA board and I found mine to get pulled out causing no power out. As I remember it looked normal but no RF out. You can't see the connector since its inside the metal box

The cables just push in and can be pulled out pretty easy

Of course I did not find out about this until after putting it all together and NO OUTPUT. Pull it all apart and found the cable pulled out

Good Luck

I would try a reset of the transceiver. There is a “gentle” reset in which you lose no data and a brutal one in which all the settings are gone. I forget the button combinations. Write down all the tough adjustments such as the filter peaking and similar things before trying the brutal reset. I had a similar occurrence a number of years back.

Good luck.

Don't remember the whole thread but I had my O1 apart once (rear panel off) and there's many jumper cables and one in particular that runs into the PA board and I found mine to get pulled out causing no power out. As I remember it looked normal but no RF out. You can't see the connector since its inside the metal box

The cables just push in and can be pulled out pretty easy

Of course I did not find out about this until after putting it all together and NO OUTPUT. Pull it all apart and found the cable pulled out

Good Luck

Carl,
A friend of mine had that happen with his Orion II equipped with an internal antenna tuner. It turned out to be the antenna tuner causing the problem.

5921. 565 no transmit

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-19 01:03:42 UTC
From: Luther Phillips
Topic: 5896 Message: 5921

Hello, Carl & the Group:

This exact problem happened to me with an Orion on loan from N4DD, and you may have seen some posts about it a week or so ago. I could not get the rig to transmit in any mode, and the ALC light did not blink at any setting. I could hear the rig transmitting CW on another rig sitting right beside it, but the output was so low that it would not register on a QRP wattmeter set to the mW range. I tried all types of resets and even re-loaded the firmware to no avail. After consulting with the owner, we decided it would be worth a try to rotate the small internal ALC trim pot to see if that had any effect. It did! The rig started transmitting again after rotating the pot slightly. Of course, the ALC setting was then out of adjustment, but I was able to get it back in control by keying the rig in CW mode while checking the RF out setting against an external wattmeter and tweaking the pot until 50% equaled 50 watts out, and 100% equaled 100 watts out, give or take a few. This pot setting seems to be quite sensitive, so expect some eratic power output readings while adjusting. I observed readings of 33 to 133 watts CW out with the power control set to 100% until I found the proper setting. The internal meter would read anywhere from 0 to pegged during this time as well. Also, there are other pots close by to adjust the foward and SWR readings for the internal metering if you need to adjust those, but I did not mess with them. I don't recall the name of the board that these pots are located on, but they are on the top right-hand side of the radio close to the front panel. You should be able to spot them as soon as you pull the top cover off. Hope this helps, and good luck.

73,
Luther N4UW

I would try a reset of the transceiver. There is a “gentle” reset in which you lose no data and a brutal one in which all the settings are gone. I forget the button combinations. Write down all the tough adjustments such as the filter peaking and similar things before trying the brutal reset. I had a similar occurrence a number of years back.

Good luck.

Fabio,

I just checked and it is still there. However, it is hidden
several layers down. You have to go to the radio page
and click on the picture of the Orion II and that brings up a
page that has the last version v2.041xt on it. It also had the v2,039d
firmware also.

You mention that the website has the two versions up, V2.039d and V2.041xt, just checking but isn't 2.039d a release and 2.041xt a beta ? . 2.041xt hasn't been released as such as it's recommended for anything but testing.

Personally I'm waiting on a T*T approved, fully functioning version before I upgrade.

The page http://radio. tentec.com/ status is gone. It used to predict the
future Orion firmware release schedule, as I recall, but the predictions did
not seem to come true.

Better not to have such a page than to have one that is wrong!

You mention that the website has the two versions up, V2.039d and V2.041xt, just checking but isn't 2.039d a release and 2.041xt a beta ? . 2.041xt hasn't been released as such as it's recommended for anything but testing.

Personally I'm waiting on a T*T approved, fully functioning version before I upgrade.

The page http://radio. tentec.com/ status is gone. It used to predict the
future Orion firmware release schedule, as I recall, but the predictions did
not seem to come true.

Better not to have such a page than to have one that is wrong!

There was also a beta version v2.041xl. This is the one I am running now
but have
also tried v2.041xt and don't see much difference. I do think the audio
in xl sounds
a little better then xt.

5937. RE: [orion565] Orion RIT encoder

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-24 02:16:39 UTC
From: Robert Carroll
Topic: 5935 Message: 5937

Barry-

That was for an Orion II, and it was for the multi encoder. It was posted by K4DLI, who lives near me. Based on his experience I have had some luck pressing the panel on the left side of the Orion 1 RIT. You might try this as I cringe every time I pull on the RIT knob. You may recall Paul Clinton eventually replaced my Orion I with the never-observed RIT problem with a unit from their used stock. I got the replacement back in July 2008. The RIT was fine till about 6 months ago when I saw the problem on this unit as well, pulled on the RIT knob and all was fine for weeks. It then failed again, and I pulled again. All well. But it gradually got worse and worse. By the contest this weekend I had to press on the panel or tug on the RIT for practically every QSO in which I tried to use the RIT—which was very often. I did receive the email from Paul Clinton back in 2008 saying that one user had reported a fix. The story behind this, if you haven't heard it, was that the user was a close friend of Jack Burchfield and after being frustrated with the service department set forth to find the problem and the cure and worked through Jack to get the word out to the rest of us who had complained. I am not sure whether the service department has ever actually owned up to the problem or whether they will attempt to fix it if you send a 565 in—or if they will continue to say they have never been able to reproduce the problem . Strangely enough, I sent an email to Jack today reporting my situation and asking for help. I don't want to ship the unit back unless I know the old "trouble not found you must be doing something wrong or hallucinating" response will not come back. If you or any other reflector members have a further update on the situation or more info on how to cure the problem permanently, I would like the info. I had been under the impression that this was a 5% problem when the reflector was hot with it years back, but after experiencing it with two 565's I suspect that may not be the situation as units age.

5947. RE: [orion565] Re: Orion RIT encoder

Yahoo group: orion565 (2009 — 2013)
Date: 2010-02-27 15:44:26 UTC
From: Robert Carroll
Topic: 5935 Message: 5947

I had an interesting exchange with Jack Burchfield on the RIT issue this week. He is always a gentleman, but this time was a little more brusque and brief than usual. He told me he knew I thought TenTec should have identified the source of the problem but that they still had not observed it at the factory. I had said that at least with each of the Orions I have owned the problem would show have shown up with very minimal use. Jack replied that he owned a 565, probably doesn't use it as much as I do, and rarely uses RIT but has never seen a problem when he does. To me that was not very relevant. He did arrange for a tech to be waiting for my call. I pressed him on whether the problem would be fixed or if I would experience it again. He replied that permanently fixed is a long long time. I replied that no recurrence in 7 years was permanent enough, recurrence in one year was not. No further communication after that. I don't have a lot of enthusiasm for going through the "no trouble found" cycle since they are still shooting in the dark. Sometimes doing the "press on the panel between the sweep and display" fixes my problem temporarily. At other times that does not work and it is a "pull on the RIT" situation. It seems that just about anything you do-such as dropping the panel, resoldering this or that-mechanically disturbs things enough to temporarily cure the problem. Vibration during shipment back to TenTec is apparently a 100% temporary cure based on factory data. Very frustrating. I suspect this has not been good for TenTec's reputation.

I had been under the impression that this was a 5% problem when the reflector was hot with it years back, but after experiencing it with two 565's
I suspect that may not be the situation as units age.
==== End quotation ===

I think it's a 5% problem all right, but the 5% refers to the percentage of 565 owners who have NOT had the problem.
